Deciduous Fruit Culture

By J. W. Mills

GRAPE GROWING DIFFICULTIES IN IMPERIAL VALLEY.

The conditions which confront the grape growers in the Imperial valley are so different from other grape growing districts that one who is successful in other places is liable to meet with partial or possibly total failure in this section. The climate, the soil, the manner of irrigation, are each a study and absolutely different than most grape growers have ever experienced. The newcomer who attempts to start his vineyard from cuttings does well if he gets a half stand to live through the first year.

My experience tells me that the best way for one who is new to this section is to plant his cuttings in nursery row for the first year. In this way he will learn how much water and care it takes to get grape cuttings to grow in Imperial soil during an Imperial summer. He will, by good care, get about one-half of these cuttings to make thrifty plants for next year's vineyard planting. Meantime he can be watering the ground for vineyard which should be planted in January or February. They are then on the ranch and there is no loss or cost in transplanting.

No cuttings should be longer than 12 inches. I like the three-bud cuttings, not over 8 to 10 inches long, for nursery planting. Do not leave any of cutting above ground.

There have been several kinds of grapes grown with varying success. The dark grape does not ripen up with a good "black." In other words it has too many light or purplish grapes in the bunch to be a successful market grape. The white grapes do not sunburn as badly and ripen more evenly than the dark kinds. The Malaga is and will continue to be the most productive shipper for the valley, though some think the Muscat will be a close second with Thompson Seedless a rival. We must be careful to plant varieties which will make desirable raisins in case table grapes do not make satisfactory returns. Muscats make good sized bunches either for grapes or raisins. To secure good results, however, it is necessary to sulphur the vines to prevent mildew, and the work of a small insect that gets on the vines and grows over the bunches of young fruit, making a web over the entire bunch.—Arthur S. Fell, El Centro.

A NEW PEACH.

Many peaches have been introduced in California and many are still cultivated, each having its individual advantage. These have been gradually weeded out, however, until the more desirable tested varieties are not so numerous. However, the effort is to secure an earlier or later peach than we now have and yet with all the qualities of the best. Mr. H. E. Ward of San Dimas has shown us a seedling produced on his place which fruited for the first time this year. There are two trees which show the same characteristics in the fruit and both bore heavily this season. These are of strong growing and vigorous variety, and notwithstanding they were on light gravelly soil and received only moderate attention, it not being known they were of special value until the fruit ripened, this year's crop amounted to about 200 fine specimens. They average 9½ inches in circumference, many reaching 11½ inches. The color is a rich yellow with a deep red mantle, abundant down and pleasing fragrance. Flesh is yellow, though not so marked as the orange cling. When cooked its color is faultless, and it requires less sugar to properly sweeten for canning than other peaches. The pit is small and while the flesh clings firmly to it, it is easily twisted off. This season there has been no splitting of pit but the great factor connected with this fruit is its own season for ripening. It extended from September 25 to October 15. This would extend the canning season and make it a valuable peach for cold storage. We give above an engraving made from specimens of this desirable fruit.

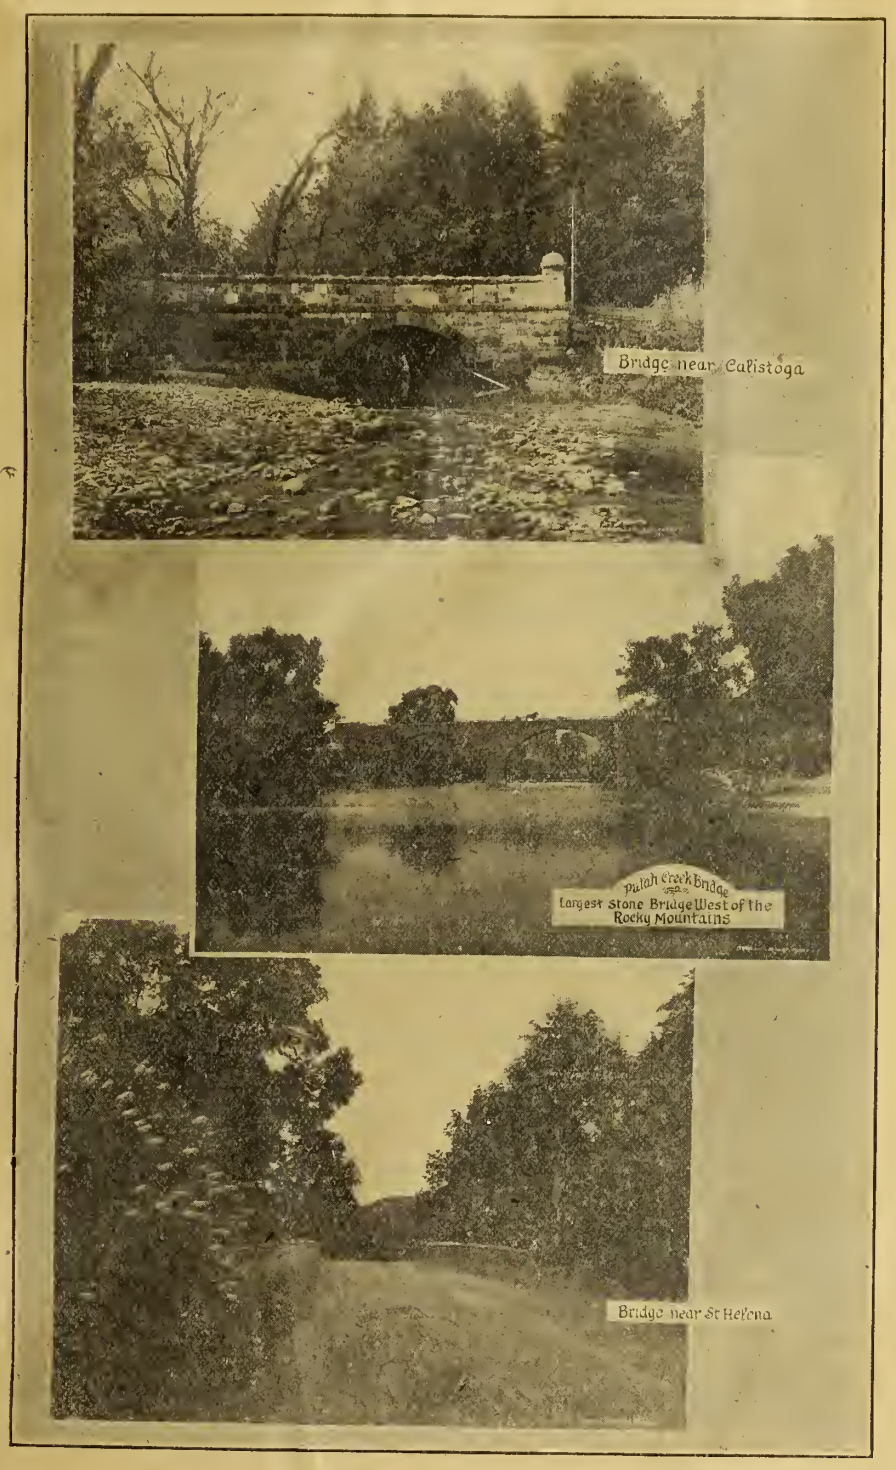
HOW GRAPES ARE SOLD.

A writer in the Lodi Herald gives the following interesting account of Eastern grape sales:

To give a person an idea of the magnitude of this thing, we will take Monday's sales for instance. There were 32 carloads of grapes auctioned off in Chicago Monday, there is approximately 925 crates to the car, each car containing from 15 to 25 different lots from different growers These cars are all unloaded into an immense building, and each grower's grapes piled separately. The men in charge of the auction open from one to two of the crates for inspection, so that the buyer or man who intends to bid on the grapes can see what he is buying.

Each lot is scheduled, and numbered according to the number that they will sell under. The prospective buyer or bidder, is furnished with a complete list, giving the name, auction number, number of crates in each man's consignment. He is at liberty to go among the different piles of grapes and examine them, but if he is caught picking off just one berry or touching a single grape, he forfeits his rights to the auction room, and is at once compelled to leave the room. By going around and examining the different consignments, he is able to form an idea of how much he considers them worth, and accordingly makes a note on his list of how much he will start the bid, and how high he will go. Then if some one else wants the lot worse than he does, he can have it. In this way it simplifies the matter. Each man knows just how much he will bid for a certain auction number, and the whole 32 carloads are auctioned off in from one to two hours. There is no chance for any crooked work the way that the business is now handled. The bids are all recorded, and shorthand reporters make a complete list of everything This list of sale which shows the grower's name, the auction number, and the number of crates in the lot, besides the price at which it was knocked off, is at once set into type. and numerous copies printed, each shipper and person interested getting a copy. Any one has a perfect right to bid, and the excitement sometimes gets to a pretty high pitch.



NAPA COUNTY'S FAMOUS STONE BRIDGES.

Written for the Cultivator by S. H. Wyckoff, Secretary of Napa Chamber of Commerce, Napa County.

NAPA County has more stone bridges than any other county in the State of California. About twenty years ago the supervisors adopted the policy of replacing all worn-out wooden bridges and culverts with stone structures. This policy has been steadily pursued until at the present time there are very few wooden bridges or culverts left in the county, and those now in use will be replaced with stone as soon as they are worn out.

While the first cost of good stone bridges is more than the wooden bridges, it is proving a most economical investment, as after they are once in place there is absolutely no cost of maintenance.

Fifteen years ago the county was spending about eight hundred dollars a month for lumber to repair the numerous bridges in the county, besides the cost of labor involved in the repairs. Today this expense has been entirely done away with, proving that while first cost of stone bridges is greater, there is a great saving in expenses after they are once established.

AN EXCELLENT BULLETIN.

Bulletin No. 196 issued by the College of Agriculture Experiment Station and written by Norman Ingham is a valuable addition to our meager literature on the Eucalyptus. Never was there the demand for information along eucalyptus lines as at present.

Mr. Ingham is in charge of the Forestry Station at Santa Monica and has had opportunity to study the habits of this tree from observing those planted there many years ago.

The Bulletin treats of the Eucalyptus for timber, for fuel and for oil. It gives method of propagation, growing, etc., also short description of those tested in California.

It is well worth the asking and may be had by writing the Station at Berkeley.

AGRICULTURAL HUNGARY.

The Cultivator has received a well printed and tastily arranged book entitled "Agricultural Hungary" published by the Royal Hungarian Minister of Agriculture, Budapest. It treats of agricultural possibilities and methods of work of that country. Of especial interest is the chapter on forestry in which we note this statement. "The state annually distributes, free, some 42 to 43 million saplings for the afforestation of barren tracts: these tracts are planted at the rate of about 4,000 hectares yearly. The state further devotes a certain sum for afforestation purposes."

Some recent figures indicate that the importation of walnuts and almonds in 1907 was about 40 per cent greater than in 1906. This is about the rate of increase shown the year previous.

A few years ago the large, thin shelled nuts were eagerly sought for propogating purposes. Now the tendency is to find nuts of medium size, with plump kernels, that are produced by trees which bear regularly and abundantly.

EUCALYPTUS SEED

Eucalyptus rostrata, the Red Gum
E. corynocalyx, the Sugar Gum
E. tereticornis, the Forest Red Gum
E. globulus, the Blue Gum
E. citriodora, Lemon-Scented Gum
E. cornuta, the Yate Tree
E. polyanthema, the Red Box
E. leucoxylon, Victorian Iron Bark
and Many Other Valuable Sorts

I shall be pleased to correspond with prospective buyers and give particulars as to prices on the seeds I am offering. Trial packets of any variety 15c each, 2 for 25c, or twelve for $1.25. Also young trees of many varieties for sale. Send for circular and cultural directions.

345 S. MAIN ST., LOS ANGELES

Australian Eucalyptus Seed

Our Mr. R. S. Webb (a native Australian) has just returned from that country with seventeen varieties of Eucalyptus seed, comprising the varieties that have been tried in Australia, and each variety is the best for the particular purpose for which it is used, or for the particular soil and climatic conditions where they grow.

The following are some of the varieties of Eucalyptus trees preferred by the lumbermen and manufacturers of Australia:

1. Iron Bark (Panniculata)
2. Microcorys (Tallow Wood)
3. Black Butt (Pilularis)
4. Turpentine (Syncarpis)
5. Resinefera (Mahogany)
6. Tereticornis (Red Gum)
7. Saligna (Blue Gum)
8. Corynocalyx (Sugar Gum)
10. Spotted Gum (Maculata)
11. Jarrah (Marginata)
12. Sideroxylon (Iron Bark)

We will have trees of the above varieties for sale about February 1st.

RACES WITHOUT BETTING.

Last year the Oregon State Fair Board put an end to racetrack gambling at the fair grounds, and the result seems to have been a disappointment to those who confidently assert that "you can't have races without gambling," says an editorial in the Portland Oregonian. So great was the interest in last year's races that the Board has found it advisable to double the capacity of the grandstand, and this has been done. This does not mean that the attendance has been doubled, or will be, for presumably part of the space upon which the new grandstand has been built was formerly occupied by people who stood up while watching the races. Doubling the grandstand indicates two things, however—that the attendance has been and will be as large as before gambling was eliminated, and that the crowd will be a more orderly one. The gambling element found pleasure in jamming and jostling in front of the grandstand. By this means excitement could be aroused and the work of the "touts" could be facilitated. Those who do not bet on the races find it more pleasant and convenient to sit down, and they will now have an opportunity.

The race without gambling has many advantages over the race upon which pools are sold, and has no apparent disadvantages. To the lover of clean sport the race free from gambling is just as interesting and exciting as any speed contest upon which bets are made. Such a race is much more satisfactory, for there is no suspicion of unfairness, as there often is when large amounts of money are to change hands upon the result. But the race without gambling draws a considerable number of spectators who have conscientious scruples against lending the indorsement of their presence to any occasion which includes a violation of both civil and moral law. Such people have no hesitancy in attending a race meet where pool-selling has been discontinued. While gambling was never very extensive at the Oregon State Fair, the fact that it existed, with official approval, had an injurious effect. The crowds will be larger, instead of smaller, with the betting eliminated.

A WATSONVILLE PACKING HOUSE

SUGAR BEET INDUSTRY.

In the eighteenth annual report recently issued by the California State Board of Trade we find the following interesting details regarding the beet sugar industry:

Beet sugar production has become a permanent industry in California. Though there were but eight out of the nine factories operated for the season of 1907, and the output was over 21,000 tons less than for 1906, it was larger than for any other previous year but one (1902), and was only exceeded by Colorado with 183,345 tons, and Michigan with 76,078 tons. A largely increased acreage and output from the existing factories is expected for 1908, and a new factory at Corcoran, Kings county, costing $1,000,000, began operations this season. The existing factories and their locations are as follows:

Spreckles Sugar Co., Spreckles, Monterey Co.; Spreckles Sugar Co., Watsonville, Santa Cruz Co.; American Beet Sugar Co., Oxnard, Ventura Co.; American Beet Sugar Co., Chino, San Bernardino Co.; Alameda Sugar Co., Alvarado, Alameda Co.; Union Sugar Co., Betteravia, Santa Barbara Co.; Los Alamitos Sugar Co., Los Alamitos, Orange Co.; Sacramento Valley Sugar Co., Hamilton, Glenn Co.; Pacific Sugar Co., Visalia, Tulare Co.

The production of eight of these nine factories for the year aggregated 72,889 tons of 2000 pounds of sugar which, at 3½ cents per pound, represents $5,102,230.

The growth of the beet sugar industry in California is shown in the following exhibit for twenty years, beginning with 1888, that being the first year statistics were obtained and published by the State Board of Trade.

Beet Sugar Production of California.
Tons of 2000 lbs.

1888	1,910	1898	18,086
1889	2,457	1899	41,100
1890	3,351	1900	30,319
1901	5,224	1901	68,700
1892	10,761	1902	73,761
1893	17,420	1903	65,360
1894	18,615	1904	59,147
1895	23,827	1905	64,251
1896	31,815	1906	94,285
1897	35,280	1907	72,889

IMPORTING FRUIT FROM AFRICA.

As the seasons on the other side of the equator are reverse of those in the Northern Hemisphere, it has been thought that it might pay to bring fruit from such countries as South Africa when it is scarce in Europe. Accordingly, nearly three hundred tons of oranges and lemons were carried from Natal to London last summer. They arrived in good condition, but the freight charges were too high for profit.

A consular report from South Africa, received in Washington indicates that the experiment is to be repeated this year. Of course, the utmost care in packing and storing on shipboard is necessary to iusure arrival in good condition. Much higher temperatures are encountered at sea on the way from Natal to London than between New York and English points.—Ex.

Pioneer Rubber Sanded Roofing

The Roof that "proves," sun-proof and rain-proof; needs no paint or repairs. Following are a few "Wont's" about Rubber Sanded Roofing:

Won't chip. Won't warp.
Won't tear. Won't crack.
Won't rust. Won't decay.
Won't shrink.
Won't crumble.
Won't need repairing.
Won't absorb moisture.
Won't attract electricity.
Won't need any paint to preserve it.
Won't be affected by any climatic changes or conditions.
Won't cost as much, in the long run, as other roofing.

What Rubber Sanded WILL do is told of in our booklet "ROOF TALK," which will be sent free upon request, together with samples of the Roofing itself.

MILK MAKING.

THE knowledge of the ordinary consumer of milk is vague when it comes to bacteria. It is therefore a great big bugaboo to them. I had one well educated woman bring me milk she said was full of bacteria, she could see them. When the milk was seen it had several dozen vinchoppers drowned in it. I told her if bacteria were bugs and that visible to the eye no one would think much about them. It is the fact that they are invisible and of the lowest forms of vegetable life, excepting that a few disease germs are considered as animal. We feared them, as they were insidious from their minute character. They seemed to be everywhere, waiting merely the proper soils and temperament to spring into active life.

Tuberculosis.

The one disease germ that we fear most from the cow is tuberculosis. The late congress at Washington, with the exception of Dr. Koch, regarded it as certainly affecting the human race, yet many do not today regard it in the bad air, for it will take up bacterial growths fully as well while cooling down as at any other time. When the milk is allowed to stand for a few minutes out of the refrigerator or cooling room it will pick up all manner of odors and taints as it grows warmer.

Manure.

There are few barns in Central or Southern California that manure is allowed to pile around. Usually the fault we have to contend with is having the cows wallow in mud during the rainy days. Now while paving the barnyard is distinctly beyond our means, we can lessen the filth materially by having the mud made of clean dirt. During the past week we have been busy scraping the corrals. This fine earth soaked with manure is one of the best things I know of for the strawberry and asparagus beds. It carries few weed seeds. Again, we are killing two birds with one stone. Farmers must make everything pay as it goes. We waste enough each year by not patiently picking up the little things that mean

ARIZONA COWBOYS.

the bacilla as identically the same. Still it would be poor comfort to a person having the disease to be told it was the bovine form, not the human form, he was dying with. The principal source of contamination of milk with these germs is not through the udder but from the manure getting into the milk. Covered milk pails and clean cows with whitewashed stables are, therefore, an important factor in keeping the milk free from disease. A cow sufficiently diseased to show the trouble should be taken from the herd. Then treat the rest with tuberculin and remove the reacting cows to others quarters and clean up thoroughly. These reacting cows, if still in good physical condition, have a good chance of recovering if they are well fed and have only open shed to shelter from the rain. Their milk can be boiled and calves or pigs raised on it.

Taints.

There are many other things besides the disease germs in the way of the milk producers. One of these is tainted milk. While the milk is cooling, yet warmer than surrounding air, it does not take on the odorous taints. This is the reason that sweet milk can come out of a foul stable. The milk man often reasons that it does not hurt the milk if the stable smells. Where there are only a few cows and the milk is removed before it has grown cold, the milk escapes tainting. This will not excuse the leaving of pennies. The surface of the corrals are made as level as possible, the Fresno iron scraper brings in the dry sand from the road near by to fill holes and the final leveling is done by running the old buck scraper over it all. Making the ground slope away from the barn helps to run the water away from the buildings as much as possible.

Milkers.

These little lifts make Alex smile. I wish I could show you Alex as I saw him come down from his room today to do the milking. He had fed the cows, swept the floor free from the dirt they carried in on their feet and freshly sprinkled the floors and gutters with gypsum. Then he went to clean up for the milking. His face, arms and hands had been scrubbed until one could see soap and water had done its best. Nails scrubbed as well. Newly washed overalls and jumper made him fresh. Years ago he worked here and received careful training under Manuel. The careful training of the men on the ranch will continue, handed from one to the other for years, until it becomes a ranch tradition that certain things are always to be done in such and such a way. Foremen may change and men may come and go, but the results of insistence that certain things must be done, remain established.

Gentleness.

Alex is kind to the cows and I often stop as I am passing to listen

MAKING AND SELLING A MILLION

CREAM SEPARATORS

AND THE KNOWLEDGE GAINED

Thirty years ago Dr. De Laval invented the first practical centrifugal cream separator. Since that time the De Laval Separator Company has manufactured and sold one million DE LAVAL machines. These separators are today in use in every civilized country in the world. They have been operated and criticized everywhere. Through all these years suggestions for their improvement have come by the thousands from every quarter of the globe. These have been investigated and tried out from time to time. The best have been adopted. The 1908 improved DE LAVAL cream separators represent the thirty years accumulation of such ideas and experiences. They represent the knowledge and experience gained through the manufacture and sale of one million machines. If in your lifetime you had milked one million cows, wouldn't you feel that you knew how to milk a cow just a little bit better than someone who had milked but one thousand? That's the way we feel about the cream separator. Our knowledge of its manufacture and practical use is many times greater than anyone else's. If you are thinking of buying a separator can you afford to ignore the knowledge gained by making and selling a million separators? We don't believe you can. We offer you the 1908 DE LAVAL for your most critical examination. An illustrated catalogue will be mailed for the asking. Write for it today.

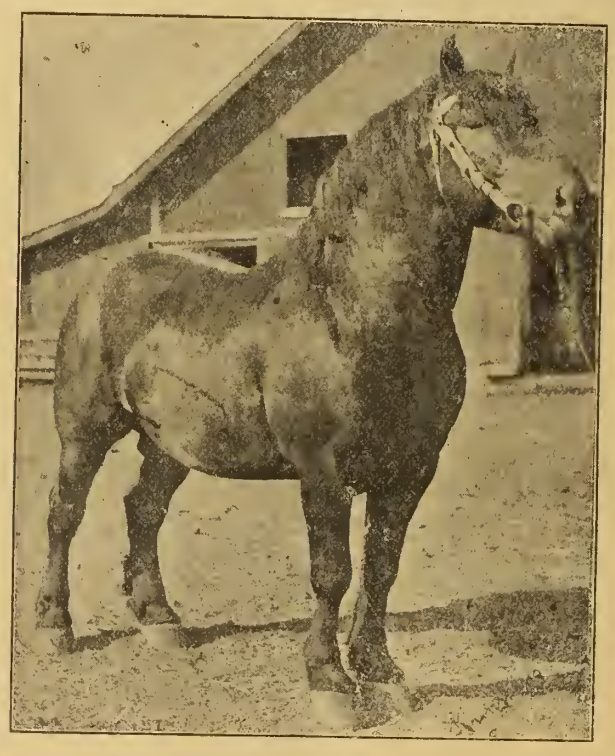
The exhibitor of the first premium butter at the State Fair whose name could not be deciphered has proved to be the Thompson Brothers of Petaluma.

to him talking in a low voice to them. He will stand by the open gate of the corral at the barn as the cows follow him in from the field. They move slowly along and he calls them. "Come, baby, come, baby." The great creatures move slowly by him into the barn. Sometimes one cow stops and locks the procession. Alex comes up and lays a gentle hand on her, petting her, while he admonishes her by saying, "Baby, baby, go in. Don't you see sister is waiting? She wants to come in, too." The cows are a good test of the gentleness of the milker with them. If the old matrons of a herd run away when any one comes to see them, there is something wrong in their case. The young heifer may not at first be as fearless but she soon understands that she is not to be hurt. In a short time she freely adopts the milker as a new form of calf and enjoys being milked. Indeed, being milked should be a soothing operation enjoyed and not dreaded by the cows.—M. E. Sherman.



A TYPICAL DRAUGHT HORSE.

ROPY MILK AND CREAM

During the month of June, two men in one day called at our office to inquire about the cause of "ropy" or "stringy" milk. One man said that a neighboring milkman had lost hundreds of dollars' worth of milk from this cause last year. He had had considerable trouble from the same source and was anxious to know how to prevent a recurrence of the difficulty. He said he had come on the excursion to the college chiefly to get some information on the subject. The subject of "ropy" milk is very thoroughly treated in bulletins Nos. 165 and 190 from the Cornell Experiment Station at Ithaca, N. Y. What we shall say on the matter will be based largely on the work contained in these bulletins, as we fortunately have never been troubled with this special ill of the milkman. Next to the man growing fruit and vegetables, we believe the milkman has the largest crop of small troubles of any other kind of a farmer. The cause of this "ropiness" in milk or cream is small plants with a very big name—Bacillus lactis viscosis. This ropy condition of milk caused by bacteria is to be distinguished from milk produced by a cow suffering from garget or inflammation of the udder and which may contain pus-like material.

"Ropy milk or cream is objectionable on account of its unwholesome appearance rather than because of any known harmful effect caused by its consumption. The slimy viscous condition of the milk is exceedingly disgusting to the consumer and its occurrence constitutes a serious menace to the success of a milk route. This fault in milk is one of financial rather than hygienic importance."

The author of the bulletins points out that "the surface of the vessel of milk and therefore generally the cream becomes viscous and will spin out in long fine threads." Skimmilk is just as liable to become ropy as the cream or whole milk. "Cold does not prevent the occurrence of the slimy condition. After ropy milk has once appeared in a vessel of milk, a fruitful source of future trouble is occasioned by careless scalding of the vessel when it is washed. The bacteria left clinging in the crevices are sure to survive a hasty scalding and will again seed down the normal milk placed in it."

The various experiments of the author lead him to believe that the dust of the room in which the milk is kept and the ice water in which the milk is cooled are the two most fruitful sources of the bacteria. Of these two, under ordinary conditions, the water for cooling the milk is likely to be the chief source of trouble.

In order to disinfect the water box or tank used for cooling milk it is necessary to use a disinfectant which is odorless, otherwise the milk and cream may become tainted from this source. For the purpose, potassium bichromate, which sells at about 35 cents a pound, is recommended. The quantity to use is about one to one thousand of water, or an ounce of the bichromate to each cubic foot of water. As the bichromate is poisonous, it needs to be used with care. It is not nearly so dangerous a poison as "corrosive sublimate," which is also a good disinfectant about the dairy, and without smell. The advantage of the bichromate is that it colors the water a yellow color, so that there is no danger of persons or animals drink-

ing it. The "corrosive sublimate" is colorless and might do harm if not carefully used. The bichromate of potash is put directly into the tank of water after cleaning it as thoroughly as possible. The cans of milk may then be placed in the chromated water without danger so long as the water is not splashed into the milk.

The author's conclusions are worth quoting:

"1. Ropy milk contains bacteria that are responsible for its viscid condition. These bacteria live naturally in water. Measures for the prevention of the trouble must be directed to preventing the bacteria from getting into the milk.

"2. After milking at night the milk pails and strainer cloth should be washed and scalded before using in the morning, or a second set thoroughly clean and scalded should be used in the morning. The practice of merely rinsing pails and strainers in cold water at the barn at night offers an opportunity for the introduction of the bacteria into milk directly from the water.

"3. If the cows wade in mud and smear the udders with dirt and filth, put a stop to it. By this means many objectionable bacteria get into milk by falling into the milk pail.

"4. The floors of all rooms where ropy milk has been kept should be disinfected with a mixture of five parts of crude sulphuric acid to 95 parts of water. [Note—Great care must be exercised in mixing sulphuric acid and water, else an explosion may result.]

"5. All milk utensils should be scalded most thoroughly daily. Never let cold water come in contact with utensils unless they are scalded before using for milk again.

"6. Exercise the greatest care to prevent even a drop of water from the cooling tank getting into the milk That occurrence is probably the most common cause of trouble from ropy milk. If water must spatter about, the cans standing in ice water should be covered.

"7. Utensils after washing and scalding should stand upside down to prevent the accumulation of dust on the inside."

The foregoing suggestions may save many dollars to more than one milkman and save a lot of anxiety on the part of customers who are usually needlessly alarmed at the appearance of "strings" in milk or cream. We know from letters received and from personal talks with dairymen that it is a serious trouble, but if the precautions outlined are observed, the trouble can be prevented; or if already in the dairy, can be overcome. Where the trouble has been, consumers need to scald all utensils and give special heed to the refrigerator or other places where milk is kept. Consumers as well as producers must try to overcome the trouble.—Hoard's Dairyman.

ALL BARREN COWS AND HEIFERS CAN BE MADE TO BREED.

This can be none with little trouble and expense if given proper attention Many a valuable cow and heifer has been sacrificed or disposed of for the reason that she was not made to breed. This may have been due to a lack of proper knowledge along this line.

It is very important that a cow, in or to conceive, be in a reasonable healthy condition. The genital organs should be in a condition to perform their functional duties as nature would have them. A lack of secretion or an excess of secretion, renders conception difficult. A lack of ambition or vigor, or an over amount of either is an unnatural condition of the genital organs.

A cow before breeding should be carefully noticed to make sure that there is no unnatural discharge from the vulva. An unnatural discharge would be a discharge of mucous that has every appearance of the white of an egg and at the period of heat usually contains a little blood.—By Dr. David Roberts, Wisconsin State Veterinarian.

Wood Soled Boots and Shoes. Boots, $3.25; Shoes, $2.00. O. J. Weber Co., 555 South Los Angeles St., Los Angeles, Cal.

LITTLE OR BIG.

Jacob Riis says: "Everything in this world is little or big according to the size of the man's understanding who is looking on."

That is a good thought for every dairy farmer to consider. The proposition of being a dairyman, of living up to a full understanding of what such a life means, all depends on the size of our understanding. For, we may well understand that the problems of every dairy farm are big enough for the strongest of intellects, the deepest of inquiry, the highest of purpose and the broadest of ambition .A great field is this dairy industry, full of men as yet of small thought, who will grow bigger if they will but listen to the teachings it has to give. This field needs men of mental hospitality, who have a hunger and thirst for the great truths that lie all about them, yet unrecognized.—Hoard's Dairyman.

HOW TO HANDLE SICK STOCK.

Place the sick animal in a well disinfected and dry box stall with plenty of bedding and sunlight. (Avoid drafts.) In cold weather place a blanket on the animal, feed sparingly with digestible food, such as bran mashes made of linseed tea; keep manger sweet and clean. Water should be pure and clean, and warmed when necessary.

It is always necessary for new milch cows to be given warm water. An injection of warm water (per rectum) should be given all sick animals, excepting those afflicted with looseness of the bowels.—Dr. David Roberts, Wisconsin State Veterinarian

The basis of making good cheese and butter is in one word—cleanliness I may venture to say that there are very few manufacturers of butter and cheese who cannot make a good article if you will give them good milk to make it from. There have been few improvements in the stables, few improvements in the care of the cows, few improvements in the milk, and not a great many, though there have been some, in the improvement in feed We know a great deal about making, and very little about how to get your milk. When the women begin to take an interest in the stable as they do in the kitchen, then we will have good milk. Women should boss that job.

DAIRYMEN

Your cows are either making money for you or eating their heads off.

Figure it out. Would it not pay to use less of high cost fodders and more sugar-beet-pulp at the low price of 50 cents per ton?

If it is milk you want you will get your money back with profit, besides you will improve the condition of the animals.

And don't wait too long before arranging to silo some of it for use after the factory closes down.

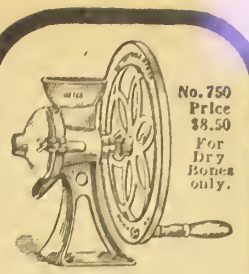
Half the work at butchering time is spent in lard and sausage making. You can increase your products and lessen the time and labor of Sausage Stuffing and Lard Pressing if you use an



No. 750 Price $8.50 For Dry Bones only.

Cracked corn, ground bone, oyster and other shells, etc., are important items of egg-making material and *must* be furnished in winter to secure an abundance of high-priced eggs. They *can* be furnished at lowest cost by the use of an

ENTERPRISE

Meat and Food Chopper

is made in standard family sizes, and not only saves half the work at butchering time, but is useful in the kitchen every day in the year. "Enterprise" Meat Choppers *cut* the meat with a revolving steel knife against a perforated steel cutting plate without crushing, and make tough meat tender. Easily cleaned, practically unbreakable, and will last for years.

Made in 45 sizes and styles; for Hand, Steam and Electric power. No. 5, Small Family size, $1.75; No. 10, Large Family Size, $2.50. Sold direct if not to be had from your dealer.

Sausage Stuffer and Lard Press

Stuffs sausage quickly and uniformly. Patented Corrugated Spout prevents air entering the casing, thus assuring the preservation of the sausage. Cylinder is bored absolutely true. Meat cannot rise above the plate.

Can be changed into a Lard Press in a jiffy. Machine is strongly made and will last for years.

Other famous "Enterprise" household specialties are Coffee Mills; Raisin Seeders; Fruit, Wine and Jelly Presses; Cherry Stoners; Cold Handle Sad Irons, etc., etc.

Look for the name "Enterprise" on the machine you buy.

Bone, Shell and Corn Mill

Order one early in the season, and the hens will surely pay for it. The mill shown in cut costs only $8.50. Will grind corn, *dry* bones, oyster and other shells, etc., making valuable poultry food. May be used for making bone meal fertilizer.

A good all-round mill for farmers and poultrymen, and for strength and durability is unexcelled. Weight, 60 lbs. Capacity, 1¼ bushels of corn per hour. Look for the name "*Enterprise*" on the machine you buy. Sold by Hardware and General Stores, etc.

FREE—The "Enterprising Housekeeper"—a book containing over 200 choice recipes and kitchen helps. Sent on request.

THE ENTERPRISE MFG. CO. OF PA., 229 Dauphin Street, Philadelphia, Pa.

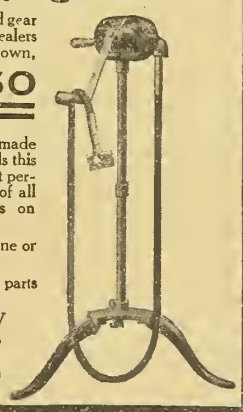
Clip Your Horses

with this superb **Stewart No. 1 Ball Bearing Clipping Machine**

The great enclosed gear machine at your dealers all complete, as shown,

only $8.50

No machine ever made at any price equals this one. It is the most perfect in every way of all clipping machines on the market.



It turns easier, clips faster and lasts longer. If you have but one or two horses it will pay you to have this splendid machine.

The gears are all cut right out of the solid bar, and all wearing parts are file-hard. It will last a lifetime.

WEAR UNIFORMS.

Some fair associations have begun to request exhibitors of stock that those who lead the competitors out for judging or for display in the arena on live stock days shall appear in uniform or in neater garments than usually have been worn. The attendant who leads the animal is more often the stable boy fresh from his work who presents a most slovenly appearance. This was quite apparent at the State Fair where the stock exhibited by Crouch & Sons was led by attendants in white suits neatly ornamented with darker braid. Some practical old farmers poohpoohed the idea, claiming that it was an effort to have the attendant rather than the stock judged. We do not think that is the idea in the case, and it should in no sense wnatever make any difference with the idea of quality of the animal. But it is an indication of the painstaking care of the stock owner and shows that he is a man looking after the little details. As to the entire effect of the parade or the fair exhibit, it cannot be gainsaid that it would be much more attractive.

Speaking along that same line, the Rural Spirit recently remarked:

"The expense of providing attendants in charge of a herd with a neat uniform of some cheap serviceable material with the name of the herd or breeding farm inscribed on the blouse or cap is very small and not only renders the attendants of said herd much more presentable, but serves as an additional and effective means of advertising. After the cleaning up is done it is only a matter of a minute or two to don the uniform and the added self-respect will well repay the trouble. We hope our exhibitors will generally heed the suggestion in some of the premium lists and instead of the decollete, don the khaki."

IMPROVING COUNTRY LIFE CONDITIONS.

The commission appointed by President Roosevelt to investigate as to conditions socially and financially of the farmers of the country is getting down to active work. The commission has recently sent over the country a series of questions asking for information as to farmers' social, intellectual and business privileges. Is the postoffice giving the farmers proper service? Are the telephones, insurance companies and other factors all they should be? And a hundred and one other questions which will give to the commission a general idea of farming conditions the country over. It is to be hoped that this will lead to more attractive surroundings in farm life, and will succeed in inspiring the farmer with using the natural beauties around him in a way which will make the country, as it surely can be made, far more attractive than the city.

RETURN OF OLD FARM DAYS.

In the handsome new marble building of the Agricultural Department are preserved the archives of the great American farms, which indicate that with the high prices of products and the bountifulness of crops, the farmer of today is likely to enjoy to the full the fruits of his labor, and that there has also been for the last quarter-century a decided trend toward making farm life more popular among young people than it has been in the past.

The time is coming when country life will attract the farmer boys and others from low-priced positions in the city back to the soil. The loneliness and dreariness of farm life are passing with the telephone and rural free delivery. This is all embraced in the action of President Roosevelt in appointing a commission to report and investigate on how to make farm life even more attractive to the boys already on the farm and to those who are struggling for a mere pittance and bare existence in the over-crowded cities.—Joe Mitchell Chapple in October National Magazine.

BE CAREFUL.

A Coachella Valley paper devotes considerable space to advocating the planting of quantities of camphor in the expectation that the manufacture of camphor for commercial purposes would be attended with great success. The paper says that one acre will yield a profit of $450. It doesn't say whether that is annually or for a period of years. In either case we feel that it is sufficient to remind the farmers, especially those who are not largely supplied with money to carry through such an experiment, that such an effort might possibly prove disastrous. While Coachella Valley may have proper conditions for growing the camphor tree the amount of labor required to put up this product and the fact that it has never been handled in this country except in an experimental way, should be sufficient to impel the farmer to proceed with caution. For experiment stations to take up this matter, or for the wealthier farmers to plant experimental plats is very wise and may possibly lead to a great industry which will add wealth to our farming communities. But until this is proved out we think the best plan for the farmer of small means is to stick to the staples.

TEST THE COWS.

Co-operative testing of the cows has succeeded in raising the average production of cows in Denmark from 120 pounds per cow to 200 pounds. Such an increase as that would mean that a farmer keeping 25 cows would have his yearly income increased by $500. The increase was brought about as much by the friendly rivalry between neighbors when once they started in their breeding experiments. Here and there in California are farmers engaged in making their own tests and in working up the quality of their own stock. But this organization of a co-operative society with the added inspiration of rivalry and the comparing of notes would certainly be a great factor in increasing the average yield of California cows. Let dairy communities stand together and make some such effort for a few years and observe results.

INTENSIVE GARDENING.

The Cultivator recently had a short article on the French method of gardening which caused some comment on the part of subscribers who wished to know more regarding it. This week we have a communication published as the leading article on the first page from a valued subscriber in England who has observed this style of soil culture. In the article is a timely warning to the uninitiated not to attempt a class of work for which they are not fitted by long training. French gardening is a trade by itself and the novice must not think that he can pick it up at a day's notice.

We expend annually $80,000,000 for road construction and maintenance and three times as much for the difficult transportation of our products over the roads.

In California we have a very serious highway problem to work out under uniform laws because of the extent of the state, the peculiarities of climate, and the varying topographic conditions. Yet it can be worked out to a satisfactory solution and to almost an ideal condition by organization, unity of purpose, sane legislation, and the aid of science in administration as well as in road building. We are transporting from 5,000,000 to 7,000,000 tons of agricultural products annually over imperfect roadways at a cost for such transportation of $10,000,000 to $12,500,000.—J. M. Eddy at State Farmers' Institute.

In welcoming you to all this and its beginning, the best we can hope for you is that you may take time to wander over the farm and dream a little of its possibilities; and in the wandering and dreaming be filled with some of the loyalty we feel for the great institution here represented, and with some of the enthusiasm we feel for its future; an enthusiasm borne of a proper conception of the largeness of the enterprise, a proper conception of all that it means of progress in the agriculture of California, and a proper conception of its power to develop the manhood and womanhood of California.—Prof. Anderson, in welcome to Farmers' Institute at Davis.

In the government report on crop conditions we note that the yield per acre of barley is about 25.0 bushels, which compares with 23.8 bushels, the final estimate for 1907, and 25.5 the average of the past ten years. A total production of 167,242,000 bushels is thus indicated, as compared with 153,597,000 in 1907. The average quality is 89.3, against 88.2 last year and 87.6 the average of the past ten years.

"In the United States, disregarding certain sections, and taking the nation as a whole, I believe it to be true that the farmers in general are better off than they ever were before. We Americans are making great progress in the development of our agricultural resources. But it is equally true that the social and economic institutions of the open country are not keeping pace with the development of the nation as a whole."

It's easy enough to keep everything neat around the farm if you always put the tools away when you are through using them.

Shop Talk

SOMETHING FOR NOTHING.—On another page you will find an order blank for the use of new subscribers to the Cultivator. It provides that those using this blank who are not now getting the paper will receive it the balance of 1908 and all of 1909 for the regular yearly price of $1.00 It is an opportunity for your friends, relatives and neighbors and we will appreciate your suggesting it to them. Do it now. The sooner the order reaches us the sooner the paper starts.

Agricultural Notes of the Pacific Coast

Northern California

Anderson, Shasta county, has shipped 51 cars of fruit this season.

Petaluma poultrymen are getting ready for their annual poultry show.

About $25,000 worth of machinery has been installed in the pre-cooling plant at Newcastle.

The Winters, Yolo county, creamery is doing more business than ever before at this season of the year.

The Oroville Register calls for a greater development of the fruit industry in that section of Butte county.

Rice growers in Jacinto, Glenn county, are very hopeful of extensive planting and good returns from the rice industry.

A Lake county farmer is reported to have sold 57 hogs recently which he fattened at a cash outlay of $42, receiving for them $616.87.

The Sonoma county poultryman who is getting eggs these days is reaping a rich harvest, for prices are now the highest of the season.

Over a thousand head of cattle were brought down to Red Bluff, Modoc county, recently, to be taken to the Miller and Lux ranges near Morganhill.

The Corning Irrigation Company is to absorb another irrigation plant which, it is hoped, will lead to better management of the irrigation systems of that section.

The city of San Francisco has filed and posted its formal notice of intention to appropriate 15,000 miners' inches of water of the Hetch-Hetchy for use of the city.

Although the recent rain was comparatively light over the Sacramento valley, the fall in the mountains was such that the Feather and other rivers are rising rapidly.

Sacramento is making extensive planting of camellias. One bunch of 350 plants was recently distributed. The effort is to make the city true to its name of the "Camellia City."

Northern poultrymen are putting up a strong kick against the excessive rate of 10 cents per dozen which it costs to ship eggs to Goldfield and other mining centers of Nevada.

State Horticultural inspectors are at work in the citrus groves in and around Marysville, Yuba county. Over 4000 trees have been examined and none whatever of the pest discovered.

A Sutter county bean grower has a crop of beans which he is now gathering with a ladder. It may be explained, however, that the beans are climbers and are planted amongst the trees, up which they climb.

Several land owners of land in reclamation districts in Yolo county recently held a meeting in the effort to secure more perfect co-operation in the best possible system of reclamation.

Humboldt county creameries on the last creamery payday paid the following prices for butter fat: Central, 33; Capitol, 33; Cream City, 33; Eeel River, 32-34; Ferndale, 33; Grizzly Bluff 32¾; Riverside, 32; Pioneer, 32.

Stock men in many sections of Northern California are organizing against the custom of "standing" cattle before they are weighed. This is an abuse which cattle owners claim they will not tolerate longer from the meat buyers.

Central California

Tulare county oranges are coloring very rapidly.

Watson has already shipped something over 1000 carloads of apples.

California Wine Association is to pay $8 per ton for second crop muscats.

Turlock is using some of her fine watermelons for hog feed owing to low market.

Lodi grape packers are making rigid investigation as to cause of mold of grapes in transit.

The Pajaro Valley sometimes ships as high as fifty cars of apples within twenty-four hours.

Tulare county supervisors have appropriated $1000 to aid the citrus fair to be held at Exeter.

Recent rain generally pleases the stock growers for the hope is that it will be sufficient to start the feed.

The deepest artesian well in the Porterville district is 352 feet deep. The water stands 72 feet from the surface.

Southeastern Fresno county is having a boom in citrus planting, plans being made for extensive orchards for next spring.

The Santa Clara county poultry men are making due preparations for the poultry and dog show to open in that city November 11-14.

Low grade apples, especially those covered with scale or diseased in any way have been barred from Sacramento and other large markets.

California Fruit Canners' Association has purchased all the tomatoes and other products which can be canned, of the Haywards truck growers.

Fresno county's exhibit at the Irrigation Congress at Albuquerque attracted much attention, especially the raisin seeder, which was in regular action.

The car shortage which prevailed for a long time in the Pajaro valley has been overcome, relief being secured from the receipt of 50 cars in one day.

The county supervisors of Monterey have passed an ordinance making it a misdemeanor for farmers to neglect or refuse to poison squirrels on their property.

Tulare Grange Patrons of Husbandry has put itself on record in formal resolutions opposed to any modification of tariff on horticultural and viticultural products.

The Selma packing houses are now running over time on dried fruits, which are going forward rapidly. Many growers, however, prefer to hold their raisins for higher prices.

Two thousand acres of a large ranch near Hollister have been placed under irrigation. Much of the land will this coming season be sown to grain, but thereafter will be devoted to fruit culture.

Apple men of the state are discussing the new packing and grading law which the International Apple Shippers' Association will endeavor to have passed by the National Congress this year. One feature of the proposed law is that the standard box shall contain 2150 cubic inches, which is larger than the box now used on the coast.

Southern California

Corona's lemons have commanded good prices this season and the market is seeking for them more each year.

A Redlands eucalyptus association will plant 700 acres of eucalyptus this season.

It is estimated that Southern California will produce $3,150,000 worth of hay this season.

A potato grower of Fullerton has what he claims as black potato scale infesting his crop of potatoes.

Recent showers were the cause of bringing great quantities of walnuts to the ground and aiding the pickers.

One ranch in the Imperial Valley has 35 men at work cutting the heads from the 400 acres of Egyptian and Kaffir corn.

El Centro, Imperial valley, land owners are planning to secure additional water for land which is now above the ditches.

Southern California's total returns from sale of agricultural products this year is estimated to be something in excess of $30,000,000.

Interest in orange culture in Coachella and Imperial valleys is increasing and quite extensive plantings are promised for the coming season.

The Cawston Ostrich Farm with headquarters at South Pasadena has secured 3000 acres of land near San Jacinto and will stock with ostriches.

California Lemon Company located at San Diego is buying all the cull lemons possible to secure at $5 per ton for the manufacture of citric acid.

Strange as it may sound, some cattle in the San Bernardino mountains have been hemmed in by snows and it is feared they may starve or die of the cold.

Southern California's production of beans this year will amount to about 35,000 tons; walnuts, 8000 tons; sugar beets, 105,000 tons; celery, 2000 cars, and honey, 1000 tons.

The Whittier Citrus Association shipped 516 cars of fruit. The average weekly pay roll of this association is $679. More members will be in the association next year than last.

The Cucamonga Citrus Fruit Growers' Association recently elected directors for the coming year as follows: L. M. Ledig, Isaac Mowrer, Hamilton Johnson, S. G. Cousins, George Thayer, George C. Stone. The navels for the year netted $2.10 to the growers.

Riverside Fruit Exchange this year shipped 1578 cars of oranges and lemons. The members of the board elected for the coming year are: George Frost, S. H. Herrick, W. P. Russell, M. J. Daniels, J. E. Cutter, L. A. Brundige, A. P. Johnson, C. H. Low, R. Brinsmead, L. C. Waite, H. G. Reed.

The large number of hives of bees which has been taken to the Imperial valley this season on account of short pasturage in other sections has overstocked that section so that the bee pasturage is exceedingly short. The Imperial Valley Bee Keepers' Association has resolved to discourage the future establishment of apiaries closer than two miles to any other established apiary.

The Coast

Strawberries are being received at Tacoma and commanding $4 a crate.

The St. John Washington Farmers' Union is endeavoring to start a Union newspaper.

The annual fair at Phoenix, Arizona, will be held for a full week, commencing November 9.

"Crown rot" is a disease which is proving quite serious in the citrus orchards of Hawaii.

The biggest icing and pre-cooling station in the West is to be constructed at Carlyn, on the Central Pacific, in Nevada.

Fig trees in the Hawaiian Islands are infested with a small beetle which causes the fruit to prematurely ripen and decay.

Farmers near Astoria, Oregon, have received from $10 to $20 per acre from stumps taken from their farms for wood distillation.

A Hood River, Oregon, fruit grower who has picked 10,000 boxes of apples has gone east and will sell his crop direct to the retailers.

The Hawaiian Experiment Station is successfully growing some plants of Mocha coffee and over 900 plants have been sent to various planters on the island.

It is predicted that the farmers of the Salt River valley will find a great commercial advantage in the sugar factory established at Glendale, Arizona.

The Horticultural Inspector of the port of Honolulu boards about thirty vessels a month in the search for fruit pests which may be introduced into that island.

Beginning with October 12, the Seattle-Tacoma circuit of Farmers' Institutes in Washington has a series of Farmers' Institutes which will extend well into November.

Experiment Station of Oregon Agricultural College is promoting the culture of cranberries in a section of Oregon which it is claimed is admirably adapted to that industry.

A deadlock which has been on between the Fruit Growers' Association at Cheney, Washington, and fruit buyers, has been declared off with 150 cars of fruit sold to an eastern firm.

A Hawaiian investigator has found that the leaves of the prickly pear cactus, cut into bits and thrown in the pools where mosquitos have bred, effectually rid the water of the wigglers.

Oregon now holds second place as a contributor to the reclamation service fund. The entire fund now aggregates $50,000,000, of which Oregon has furnished over $8,000,000 from its sale of public lands.

The Gresham Fair conducted by the Patrons of Husbandry of Multnomah county, Oregon, has proven a great success financially. The surplus, after paying expenses, is sufficient to guarantee a good fair next year.

The inspector of Josephine county, Oregon, recently caused the rooting out and entire destruction of the trees in a large orchard because of their infection with San Jose scale. The orchard was neglected and had been for several years the cause of spreading the scale through the section.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used those machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

70c Eggs

Will they sell for that this season? Some say so. Will you get your share of this good money? More reason than ever with feeds so high that you should feed a scientifically balanced ration.

Egg-More

is not a strong tonic and stimulant, but a highly nitrogenous, concentrated Poultry Food, very rich in protein. A little fed daily with good grains will keep hens healthy, make them molt early, feather out quickly and lay lots of eggs. Have you tried it? Many have and are pleased. Here is just one:

F. W. Healy, the well-known banker and fancier of Pasadena, writes: "After hearing others praise Egg-More, I determined that if there was anything to keep hens laying through the fall and winter months, I wanted it. I bought a package of Egg-More and fed it and the improvement was very marked. Keeping on with it I soon proved the truth of your statement that 'you can't put all your eggs in one basket if you feed Egg-More.' I have raised poultry nearly all my life and for twenty years in California, but never did my hens lay so well as since I began to use Egg-More. I consider it the best egg producer on the market, and I do not intend to be without it."

You better try it. For sale by many dealers. If not by yours we will prepay freight on 12½ lbs., $1.00; 25 lbs., $1.90; 50 lbs., $3.60; 100 lbs. $7.00

Are you in the race for any of our

$50 Cash Prizes

$20 first, $10 second, $5 third, fifteen $1 each. Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

A TALE OF TAILS.

ONCE upon a time the writer was young. It was a very long time ago as gray locks will testify, but as a laugh is a good thing to "pass on" will tell about it, with "ye editor's" kind permission.

I was a miss with a greater fondness for pretty cothes than my purse warranted and one fine autumn I found I had exceeded my allowance, and while I had a fine, new "myrtle green" suit and trimmings, I simply didn't see how I was to get proper trimmings for a new hat to wear with it.

I had been visiting in a neighboring city and had become enamored of the new glossy green-black "Coques-feathers" which the elite were then wearing upon their hats, but, alas! the price was beyond my reach.

It seems very silly now, but my happiness just then seemed to be hinged upon the possession of these plumes, which would just finish off my suit to perfection. My next door neighbor was a young married woman who was in just the same predicament. She had also a new green suit and no suitable hat trimmings to go with it and she confided to me that her husband didn't feel that he could give her the money just then, for he had invested in some very fine chickens which he intended showing at the fair and she must wait for the prize money, which he would surely win, before buying her hat decorations.

She wanted me to see the chickens but I had no interest whatever in such things and it was only after considerable urging on her part that I was induced to accompany her to the barn to see them. Once there my enthusiasm knew no bounds for those chickens were of the black Spanish variety and one look at their glorious green-black tail feathers was enough for me

Breathlessly I told her of the fashion and the rage for those "coques-feathers" in the city and what perfectly lovely hats we could have if only we pulled out the tails of those two roosters.

She fell right in with my plans and offered me half the feathers if I would trim her hat also, an offer I was not slow about accepting. Of course, we thought it wouldn't really hurt the birds any to speak of and when we got through with them those prize roosters were a sorry sight.

Happily we set to work upon our hats and they certainly did justify our direful deed in our own minds, anyway, for they were as handsome as any I had seen. But the language of that unhappy man when he went to feed his pets that night would surely burn this page, if transcribed literally.

In the light of my present knowledge I don't blame him in the least and can fully realize what his feelings must have been, but then I didn't know, so I stamped my foot at him and called him a "mean, stingy old thing, to begrudge his wife even the tails of his old roosters to trim her hat with" and the humor of the situation began to dawn upon him, and he vowed vengeance by threatening to tell all over town where our beautiful, stylish hats came from. But he didn't. The joke on him was too obvious, so we wore our stolen plumes in triumph and the birds grew another set quite as fine, so he won his prizes, later on, and quite forgave us our terrible tail thieving.

TO THE FARMERS' WIVES WHO KEEP POULTRY.

This page is called "Chicken Chat" and who ever heard of one person doing all the chatting. Now I know there are many of you who can tell us a whole lot of things that would be interesting and helpful and the editor has a standing invitation at the head of this department for letters from those who have succeeded, as well as for those in trouble. If you have found a certain food formula that gives you good satisfaction, pass it along that others may profit also. Don't be like the neighbor I used to have "away back east." This woman had some secret about making her flowers bloom which the rest of us could never discover. All winter her windows would be gay with blooms, while ours were bare of blossoms most of the time. We begged and we entreated her to impart the secret of her wonderful success but she always smiled a peculiarly irritating, superior sort of smile and said she "just took ordinary care of them, that was all." We used to wonder whether the sight of our blossomless windows seemed a tribute to her skill and justified her in keeping it to herself, but felt rather glad that we were not "built that way" and would willingly share each item of knowledge we felt would help one another and that's what we want you to do. Share your good feelings with us, as well as your troubles. Let us know when you have good egg yields and what foods produced the elusive egg. Those of you who have tried caponizing, write of your experience and whether it paid. Those of you who have tried the fireless brooders, let us know how they worked out. Those of you who have tried the Rankin system of raising ducks upon bran and grit, tell us all about your success. (I have never heard of any who succeeded but those who added alfalfa meal and meat to the ration.) A great deal has been said about the chicken business in California and we want the experience of those who are best fitted to give it and the farmer's wife is that person, so let us hear from you. I, myself, was a farmer's wife who always counted my necessities in chickens or dozens of eggs, not dollars and cents, for many years, so you are writing to one who knows what up-hill work it sometimes is and who can sympathize with either success or failure, for I have known both. All letters addressed to California Cultivator for "Chicken Chat" will be forwarded to and revised by me for publication, so do not hesitate to write because you are not "used to writing for the paper." Let us make this page at least worthy of the rest of this grand publication and that is a task worth doing and doing well.—Mrs. Frank Metcalf.

POULTRY QUERIES.

Roup.

Will you please tell me through your paper what to do for my turkeys? I have eight turkeys six months old. They have done fine until two months ago I noticed one morning, a swelling on each side of the nose and a discharge from the nose of one, and since, they have all been affected the same way. They eat well, are fed on corn and a bran mash every morning. They have free range on alfalfa and barley field. How long should they be fattened for market?—A Reader, Sunland.

I believe your turkeys are affected with a form of roup, but they may possibly have barley beards in their throats and nostrils which causes the irritation. Examine them thoroughly for the barley beards, and remove if possible. If they still show signs of catarrh, or roup, buy a nickle's worth of permanganate of potash, dissolve in a quart of luke warm water, and twice a day, duck their heads into this solution, holding the nostrils under until you are sure they have gotten a little into the throat, through the nose. This treatment will cure pretty bad cases of roup, but the cured birds should never be used for breeding.

About six weeks is the proper time to fit a turkey for market, as a rule.

* * *

Preserving Eggs.

I am engaged in poultry raising and in consequence am interested in everything pertaining to its success. Having seen recently a statement in regard to preserving eggs in "water glass" I am led to inquire if such eggs meet with the approval of dealers. If readily sold, they might be a profitable business. Can you advise me in the matter?—Subscriber.

Eggs may be kept perfectly sweet and wholesome in water glass solution, and answer every culinary purpose, if not over twenty-four hours old when preserved, but it is a nice question whether it is strictly honest to palm them off as fresh, and dealers do make a discrimination against preserved eggs, no matter how perfectly they have been kept.

If a market can be found, where these preserved eggs can be sold for what they are, at a fair price, it will certainly pay to put them down when eggs are cheap and plentiful.

I wouldn't trust the word of my own sister about the age of eggs, as eggs are usually gathered, (or left un-gathered until half spoiled.)

I have known people to come to grief buying up eggs to preserve, for while they may be candled, and seem perfectly good, there is always danger. It is well known that an infertile egg shows clear and fresh looking after being incubated two weeks or more, but that egg don't have a fresh taste, exactly, and might spoil a whole tub-full, if preserved in company with fresh ones.

In old Kentucky, the law has stepped in and draws a sharp dividing line between cold storage and fresh eggs, and forbids the former being used in public places unless properly advertised as such, and provides for a fine from $25 to $500 for a violation of this law, which goes to show how such things are regarded. So our advice, is "Go slow" try a few hundreds and see how they sell, then, if the experiment justifies you, enlarge your capacity; but I warn you, that if one person makes a success of it one year, the next year every body will be at it, thereby bringing the price down where there will be nothing in it.

But, its a poor rule that won't work two ways. While the preserving of eggs goes on, the price of spring eggs will be equalized, as preserving large amounts will keep them off the market at a time when the market is glutted, and fair prices may be obtained the season through.

My experience has been, that the better way is to keep a flock of thoroughbred fowls, pen up the best ones, and sell eggs for hatching, during the spring season. This method brings you a better price than any other can do, and if you advertise your stock properly, is safe and sure.

Of course, shipping eggs for hatching has its drawbacks, and perhaps, the preserved egg trade is only in its infancy. Certain it is, that most food products are now sold in packages, even condensed milk. Therefore, why not have a suitable package for "Water-glassed eggs. warranted fresh," of a convenient size for shelving, thus preserving them in small quantities, say a dozen and two-dozen size. The convenience of handling them thus would appeal to every grocer and house-wife, and if kept strictly up to the mark, would solve the problem of marketing eggs in the simplest way. It is worth trying, anyway.—Mrs. Frank Metcalf.

DUCK CULTURE

The most important thing is to have good healthy parent stock that is not inbred. What we mean by inbred is using male birds from your own eggs for breeders several years without getting new blood from some other source. Our practice is to get some other breeder to exchange eggs with us from which we hatch and raise our own drakes for breeding for next season. In raising stock for breeding we start from the time the present stock is hatched. These are selected from the April and May hatches and are not forced same as ordinary stock for market. They do not come to maturity in four weeks. As soon as they get their feathers (except the wings) we sort them, picking out all the most promising ducks for breeders. The drakes are put back in pens and fattened for market. For breeders we select the medium-size ducks, with drakes just a little under-sized. These we think are more active and eggs are more fertile. As soon as we have our breeders sorted we turn them out to pasture in flocks, say 200 on about two acres with plenty of shade and a creek running through the lot. They are fed sparingly on a light feed composed of three-quarters bran with the rest equal parts corn meal, low grade flour, ground oats, 5 per cent beef scrap; also one-third of entire mixture, cut clover rowen of second crop clover cut very fine, with all long stems screened out, or green corn fodder cut every day very fine. Feed all they will eat up clean quickly. Keep them purposely a little hungry. They are kept here until Nov. 1 to 15, according to weather. Then they are again sorted and put in pens 12x100 with 10x10 pen inside house, 20 ducks and 5 drakes to a pen. Each pen has a feed trough 1 foot wide 6 inches deep, 12 feet long, with another for water 5 feet long outside. Inside they have a feed trough same as others with a 15 quart pail for water not over 14 inches high. This pen is kept bedded with fine planer shavings preferred. It has a box for oyster shells and gravel size of wheat or corn. Here the feed is all changed to equal parts; corn meal, bran, low-grade flour, ground oats and stale bread or crackers, if it can be had, 10 per cent beef scrap and one-third entire mixture, fine cut clover. Steam the whole mixed thoroughly with warm water, not sloppy, but in a condition so it crumbles. Feed inside in stormy weather and outside if the snow is off the ground. They should start laying by last of December or first of January. The eggs are gathered first thing in the morniug, when one can see, to get them; also again at 9 and 11 o'clock. Later when it is warm 9 or 10 o'clock will do. As the pens are kept bedded the eggs which are laid on the floor are most all clean. Those that are soiled are washed lightly. We set our eggs twice or three times a week never using eggs over one week old. They are run in the incubator four weeks at 103, being turned on wire trays half over every twelve hours. We never open machine from time they start to hatch until all are out.. Machine is provided with a nursery under trays below into which they fall as fast as hatched and are out of the way of others that are coming out. When they are all dried off we take a bushel basket and line with paper, then put in soft cloth, first warming it; into this we place the little downy fellows, cover them up and hurry them off to the brooder house.—Misssouri and Kansas Farmer.

High Priced EGGS

Are what all poultrymen like to get during the fall and winter; but without the very best of health in the flock and a good variety of sound, wholesome feed it is hard to get such eggs.

Nature requires that hens have a rest just prior to and during the molting period; the result is a scarcity of eggs, with higher prices, and a larger profit for those who can overcome the difficulty. The one that can get eggs during the fall will be just that much ahead of his neighbors and others who fail to do so, which in the end is the difference between success and failure.

COULSON'S EGG FOOD is the feed that will turn failure into success by enabling you to secure eggs in the fall and winter while prices rule high.

Improvements have been effected in the composition of the EGG FOOD during the past year, so that it is now richer in the various nutrients required by the laying hen, and is a better feed than ever before. Coulson's balanced ration poultry foods are guaranteed to contain nothing but wholesome ingredients.

"THE RIGHT WAY," our booklet fully describes COULSON'S IMPROVED MASH EGG FOOD and other balanced rations for poultry and gives full particulars of guarantee and directions for feeding and care of poultry from the time they are hatched. If you have no copy of it, you should drop us a line today; a postal card will bring it to you.

We have agents selling our poultry foods in nearly every town in California. If you cannot obtain what you want from your dealer, write to us and we will tell you where to get it.

CAUSE AND CURE FOR BUMBLE FOOT.

Bumble foot is a form of stone bruise. It is generally caused by confinement upon hard floors or runs or may be caused by the fowl jumping on a hard surface from the perch or other high place, writes a poultryman in Western Poultry Journal. Extremely narrow perches will cause it.

In mild cases the bottom of the foot is swollen and inflamed and noticeably painful. The foot should be held in warm water for fifteen or twenty minutes, after which apply boric acid ointment which is made by adding one part boric acid to five parts vaseline. Repeat this for three days or more, keep the birds confined in a coop that has some sort of soft bedding in it. In aggravated cases abscesses form and the swelling must be opened. Dust the wound with iodoform and apply the boric acid ointment. Bandage the foot daily, keeping the fowl confined until the wound is healed.

GREEN CUT BONE.

One pound of cut bone for a dozen hens once a day, which should not cost over 1 cent a pound, will produce more eggs than five times as much grain, because the cut bone is complete in egg-making substances, while the grain is largely deficient in many respects, says Mirror and Farmer. Some persons affirm that it does not pay to procure a bone cutter for small flocks. That is a mistake. Bone cutters are now cheaper than many ordinary garden tools, and are strong, durable and efficient. The cost of the bone cutter is soon regained in the increased number of eggs laid. It is almost indispensable to success, no matter how small the flock if fully determined to secure the largest profit possible. The great saving of bones and meat, and the utilization of materials that could not be appropriated as food for fowls without their use have given green bone cutters a place on all well regulated farms. They are sold at from $5 to $10, a price which places them within the reach of all, and they have added to the profits of poultrymen, farmers, butchers and poultry supply houses.—Commercial Poultry.

APPLIANCES AND METHODS FOR PEDIGREE POULTRY BREEDING.

The Maine Agricultural Experiment Station is now mailing Bulletin 159, containing an account of methods and devices for use in the breeding of pedigreed poultry. It describes a new trap nest; a pedigree egg distributing and turning table for storing eggs awaiting incubation; an incubator basket for keeping track of pedigreed eggs during incubation; a device for mechanically banding chick leg bands, and a system of keeping pedigreed records.

On account of its technical nature, this bulletin is issued in a limited edition, and is not being sent to the general mailing list of the station. Until the edition is exhausted, however, a copy will be sent to any interested person on application.

The description of the new trap nest is issued separately as a circular, and will be sent on application. Requests should be addressed to The Maine Agricultural Experiment Station, Orono, Maine.

Exercise produces warmth, provides pleasure and promotes health. Therefore it is well to let hens hunt in a deep litter of straw for all their grain. Hens love to scratch. They do it intuitively.

We Hatch 19 Kinds of Baby Chicks

Send for price list and descriptions. We can ship them safely anywhere within 48 hours. Can refer you to satisfied customers everywhere. IS GRIT NEEDED FOR FOWLS?

Whatever Spallanzani proved and did not prove in his experiments, it is a fact, and a fact easily proven, the fowls do not eat grit without any design. Though we may not know fully the whole purpose of the use that grit is put to in animal economy of the fowl, and I have sometimes thought that grit and other hard substances perhaps were eaten by the fowls to keep contents of the crop from packing, suffice it to say that in a number of crop-bound birds examined, grit seemed to be conspicuously absent, on the other hand, if grit may not be necessary to triturate the grain so that the gastric juices may complete the processes of digestion, it may be that the grit is necessary to keep the inner surface of the gizzard in its hard, rough and horny state, same as the finest pair of hands by the handling of hard substances becomes hard and callous, hence the form of speech, "horny hands."

This theory has, to my best knowledge, never been advanced by any of the numerous investigators on the subject, though it may only add another theory to the many others already advanced.—The American Fancier.

The only rule for feeding is the rule of appetite. Keep the appetite good. To do this is the fine art of feeding. It cannot be taught; it must be learned by practice. Fowls do not eat the same amount of foods each day. Those that are laying eat far more than fowls of the same age and breed not laying. Pullets not laying eat more than the same weight of old hens not laying.

It is safe to feed in an egg ration one-tenth to one-fifth by weight of meat in the total ration, the quantity varying with the richness of the meat and other foods used. It is preferable to mix the meat in the meal feed. It is, however, fed separately, with perhaps equally good results.

The successful poultryman keeps both his eyes and ears open—always alert for the appearance of lice or mites or the first symptoms of colds or roup. Eternal viligance pays.

Rancho Los Encinas
R. F. D. 76, Glen Ellen, Cal.

DUCK NOTES.

The duck has no crop.

Ducks do not have gapes.

A sandy soil is best for ducks.

Don't forget grit in the mash.

Water ducks three times a day.

Hard grain is not the proper diet.

A duck well hatched is half raised.

Better have the ducks a little hungry.

Let the ducks make their own nests.

The weakest part of a duck is its legs.

The "green duck" is a late innovation.

Give the water first thing in the morning.

Duck eggs over a week old do not hatch well.

The Family Circle.

The great value of green food lies in its ability to aid in the digestion of other foods, thereby promoting good health, which means more eggs. For summer feeding, clovers and rape are among the best green foods. They should be provided in unlimited quantity. For winter feeding, cabbage and mangel beets are perhaps the best for feeding raw, but for cooking, turnips and small potatoes are preferable. No objection has ever arisen on account of the flavor of flesh or eggs from feeding any of these goods liberally.

The Ornamental Garden

THE NARCISSUS.

NARCISSUS—which includes daffodil, jonquil, etc—is a genus of hardy bulbous plants, most of the species of which are natives of Southern Europe. A few of the original types are still cultivated in gardens, but the most of the fine varieties now grown have been produced from seed.

Narcissi are undoubtedly the finest of our winter and spring flowering plants, and, being of easy culture, are deservedly popular. The forms of types are varied, although the range of color is limited. A number of varieties are much earlier than the majority, while a few of the best kinds are later in their blooming. Late-flowering varieties are not recommended for the earlier and hotter districts, as the blooms are not capable of enduring the hot sun or wind. In the cooler districts there is probably a fair opening for the culture of late varieties to succeed in the markets those grown in the metropolitan district.

Soil and Culture.

The most suitable soil for narcissi is a light friable loam. They will, however, grow and bloom well in any well-drained, fair, garden soil. The addition of fresh stable manure to the soil in the proximity of the bulbs is most injurious, and should be avoided. Well-rotted stable manure is beneficial when deeply worked into the soil well below the bulbs, but the best manure for all narcissi is a mixture of equal parts coarse bone meal and superphosphate, applied at rate of about 1 lb. to the square yard. In cool soil this manuring is quite sufficient, but in hot, sandy soils the addition of well-rotted cow manure to the bottom of the bed or patch is of special value, on account of its coolness and moisture-retaining properties. The bulbs are most satisfactory when planted in special beds, although they will succeed and often produce exceptional blooms when grown in borders among other plants. The advantage of the bed system is that the bulbs are not watered artificially in the resting period as is generally the case when they are grown in borders of mixed plants. In preparing soil for the reception of bulbs, the bed or patch should be worked to a depth of about 18 inches, the manure applied to the bottom 9 inches, and the soil firmly trodden before planting. Bulbs of the majority of varieties should be planted about 3 inches in depth, very large bulbs an inch deeper, and bulbs of small and weakly-growing varieties an inch less. The bulbs should be planted from 4 to 6 inches apart, and may be allowed to remain undisturbed for three years, when they should be lifted, divided, and replanted. The bulbs are ready to lift when the tops turn yellow, and should be replanted at once, if possible. Otherwise they should be dried and stored in a cool place till the latter end of March at latest. After the flowering period is over, the bulbs should not, as is usual, be allowed to suffer from want of cultivation. The longer the "grass" is kept growing the better the blooming in the next season.

The first car of walnuts was shipped to San Francisco on October 8. The new electric-salt bleach is proving entirely satisfactory.

BULBS AS HOUSE PLANTS.

Queries occasionally come, writes Prof. Paddock of Colorado Agricultural College, concerning the proper handling of bulbs for home decoration. Such information should be of general interest, as nothing adds more to the cheerfulness in the home than plants, and a few bulbs afford a pleasing and all too uncommon variety. No class of plants is of easier growth if a few fundamental principles are adhered to.

The first is perhaps a choice of kinds. The beginner will do well no doubt to experiment first with a few kinds, as a few well-grown specimens are much more satisfactory than many which give indifferent results. In this class may be placed the narcissi of various kinds, hyacinths and freesias.

Narcissi come in many forms, as the polyanthus, jonquils and daffodils. The two common forms of hyacinths are Dutch and Roman, while freesias are of but one kind.

Soil for bulbs should be made light with sand and loam, but aside from texture there is little else required. Any soil which the common house plants thrive in will answer.

Four or five-inch pots do nicely for bulbs, but the shallower pans look neater. One hyacinth bulb is all that should be grown in the smaller sizes, while from three to five narcissi, according to size, may be used. Some drainage material, as a few pebbles or bits of broken pots, should be placed in the bottom, then the pot is filled two-thirds full of soil, which should be pressed down firm, but not packed; then the bulbs are placed so that they may have half an inch of soil over them, and the surface of the soil should be at least half an inch below the top. A thorough watering is now given and the pots are put in a damp, moist place, where the temperature will remain at not far from 50 degrees. This may be in a cellar, or even in a room, though suitable protection must be afforded to prevent drying out. A common practice is to bury the pots out of doors where sufficient protection is given to maintain the required temperature. This treatment is necessary in order to secure a good development of roots before the top begins to grow. This will usually take about four weeks, but their condition may be ascertained by an examination at any time. Pick up one of the pots, invert it and tap the rim gently on a table's edge and the contents will usually fall out readily without disturbing either roots or soil. When the soil is fairly well filled with roots it is time to place the pots in the window.

Freesias are perhaps the most satisfactory for several reasons. They are very easy to grow, the bulbs are cheap and but few flowers surpass them in fragrance or in beauty. They are planted the same as the others, but as the bulbs are small, a larger number should be planted in a pot, perhaps six will be about right for a four-inch pot, a row around the outside with one or two in the center.

Unlike the other bulbs, freesias should be placed in the window at once. Keep in the sunshine as much as possible and water carefully. The plants are apt to take a spindling growth any way, so a little care will be well repaid. As the flower stalks begin to form they may need staking, but a small stake may be used which will not be too conspicuous.

After the flowers are exhausted, the plants should be well ripened by gradually withholding water, then the pots may be placed in the cellar until the next fall. The larger bulbs may be used for forcing a second time. This is not true, however, of the other kinds mentioned, as they are worthless for forcing a second time.

Malthoid Roofing

Cassin & Ish, Goldfield, Nevada, U. S. A., write: "During the last great fire in Goldfield, a building covered by Malthoid was right in the heat of the fire. A wooden shed attached to it burned, but though the roofing blistered and partly melted, it did not burn. It was the very best kind of an advertisement for the material."

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Grafting Wax.

Please give formula for budding or grafting wax. What width of budding cloth is best for wrapping buds? How is it prepared and what length should it be cut?—Subscriber, Phoenix.

Resin, 6 lbs.; beswax, 2 lbs.; linseed oil, 1 pint. Break the resin into small pieces, cut up the beeswax and place the two together in a suitable iron pot. Pour the linseed oil over them. Set the pot over a slow fire and allow the materials to melt. For waxed cloth, saturate thin muslin with the wax. Prepare the cloth by tearing it into strips four or five inches wide and winding it around sticks about a foot or so in length and one inch thick. The rolls should not be more than two inches thick, else the wax will not penetrate to the center. Melt the wax over a slow fire, place the rolls in it and allow to remain there until the wax has penetrated the cloth. The wax should not be allowed to become too hot, else there is danger of burning the cloth. Have it just hot enough to keep the wax in a melted condition. As soon as it is saturated, remove the cloth from the wax and store away When required for use, unroll the desired length and tear it into strips one-half to three-quarters of an inch wide. Some people, instead of cutting the cloth into strips, stretch out the cloth and apply the hot wax to its surface with a brush.

Spotting of Cabbage.

J. W. Anderson of El Monte sends in a cabbage from his ranch with small sprouts all the way to the center. At first we thought it a fungus and referred to Prof. R. E. Smith of the Pathalogical Laboratory and he replies: The cabbage leaves affected by a black spotting, which you recently sent us, do not seem to show any fungus or other parasitic organism. So far as I can determine this condition seems to be the effect of some injury which the cabbage received while a young plant. The black spots are small dead places in the leaves where they were injured in some way at a previous time. It is possible that it may have been done by insects, particularly the cabbage aphis or louse, which is our worst trouble with cabbage. I have not seen this condition in any other instance than the specimens which you sent.

Name of Apple.

What is the name of an apple of good size, deeply indented at blossom or stem end, pale green on one side, the other side red, mottled with green, flesh white?—Mrs. L. B. S., Fair Oaks.

The description fits Famous or Snow Apple, but of course cannot say that it is.

Scaly Bark.

Please find enclosed a sample of some bark from orange trees that are diseased. It starts about one foot from ground and works up through the limbs. The trees are 15 years old and Mediterranean Sweets. There are about 50 that have this disease in the ten acres. They have been well cared for with a fair amount of fertilizer, stable and commercial. Will this disease spread? Cannot find any in my navel trees or lemons.—D. A. C., Rialto.

Prof. Ralph E. Smith answers:

"The trouble with orange trees from Rialto is the disease called 'scaly bark.' This is a form of gum disease which has received considerable discussion of late in the horticultural press and elsewhere. The article written by Judge Call of Corona, published in the Cultivator some time ago, gives a very good description of this trouble and its treatment.

'The disease is not caused by any parasite, but is an effect of conditions of growth, the nature of which is not always easy to determine. The best treatment consists in digging up the soil very thoroughly close about the tree, cutting back the top of the tree quite severely if it is badly affected, and painting over the affected areas with neatsfoot oil, linseed oil or a 10 per cent solution of caustic potash. it is also well to cut out narrow slits of bark through the scabby portions. If the trees are badly affected it is about as well to dig them out and plant new ones, or cut back the whole tree to healthy wood, even down to the ground if necessary, and let new sprouts come up to form a new top."

Unprofitable Prune Trees.

I have a small orchard of prune trees in good heavy soil and the trees are very large, some of them measuring twenty feet across top. I do not get even a fair crop, although in the spring the trees are covered with bloom. These trees have only been known to have one good crop in the last twenty years. Some have dry rot in the butt of the tree. Could you kindly give a remedy or would it be advisable to take them out?—A. K., Geyserville.

Your trees surely have a bad record, and if there are other varieties of plum or prunes that are profitable in your section and your old trees are healthy, they might be grafted over with profit. If such is not the case we would surely dig them out.—J. W. M.

Preserving Orange Seeds.

Please tell me what is the best way of the preserving of the citrus trifoliata seeds? I have been keeping them in the moist sand and some in the paper box which is wrapped with woolen cloth, but I found out some kind of fungus on them.—T. K., League City, Texas.

This was referred to Prof. R. E. Smith, who writes: "In regard to the best way of preserving citrus trifoliata seed, I would say that the seed of this species of orange can be kept quite satisfactorily in a dry condition. Most citrus seeds have to remain in the fruit or be kept moist until the time of their germination, in order to preserve their vitality. With citrus trifoliata, however, the seed may be dried and kept for some time without impairing its power of sprouting.

"If your correspondent is unable to keep the seed in moist sand, which is the usual method, I would advise him to dry it and keep it in that condition, as he would other kinds of seed, until ready for planting.

Sowing Alfalfa.

Please inform me through the paper what is the best time to sow alfalfa?—Subscriber, Stanislaus county.

If the ground is in good condition we imagine the present to be as good

IRRIGATING HOSE

time as any time of the year. Surely it would be better than to wait until spring time. Possibly it might have been better if sown a few weeks earlier, in which case it would have been more liable to be out of the danger of frost, which may come in December or January.

Wormy Apples.

We have an orchard of very fine apples. They bear heavily but are nearly all infested with worms. What can I do to cure this evil? Are wood ashes scattered about the trunks of trees of value?—M. E. H., Santa Barbara county.

The wood ashes are of no particular value except to put the ground in better condition and to fertilize the trees. In that respect they are very valuable. For the worms you should supply yourself with a spray pump before the next blossoming time and when the trees are in full bloom or perhaps just going out of bloom spray with a solution of Paris Green water and a little lime. The proportion of Paris Green is 1 lb. to 200 gallons of water. This solution must be kept thoroughly agitated all the time the spraying is being done. Two or three weeks after this first spraying on the blossoms give a second on the young fruit which has just set, taking care to deposit as much of the poison solution as possible in the blossom end. Fuller particulars may be had as to this process next spring, when it will be in order to use. Some help may be had by placing bands of burlap about the trees at this time of year, which is allowed to hang a little bit loose and make a hiding place for the worms. As they drop from the apples, they have a habit of finding these hiding places, from which they may be taken with the band later and immersed in coaloil or hot water to kill them. This will somewhat reduce the next spring crop, and if generally practiced in the neighborhood is very valuable.

Fertilizer on Alfalfa.

Has commercial fertilizer been tried on alfalfa? What were the effects?—W. M. P., Riverside.

We do not think commercial fertilizers have been tried to any great extent. Stable manure has and invariably with good results. Lime has been recommended very highly, or still better, gypsum, which is very cheap and at the same time seems to fit the soil for alfalfa requirements as no other application will. Your other query regarding capacity of flume will be answered later.

Blackeye Beans.

I have about 300 sacks of blackeyes to sell. Can you find buyer for me at prices quoted in Cultivator?—W. N. G., Fillmore.

It is hardly probable that the Cultivator could secure for the producers wholesale prices as quoted in the paper. Those prices are given as an indication of the trend of the market and as fully explained in a long article in the Cultivator a few weeks ago, the wholesaler has built up his trade by making a large investment of capital and devoting a great deal of energy and business tact to it, so he cannot be expected to give to the producer the same price at which he wholesales his goods. If he buys of the producer or more probably the broker, which is usually the case, he will certainly advance the price over what he has paid. Should the producer of blackeye beans come to San Francisco or Los Angeles and look about among the retailers, it is barely possible he could sell at the ruling wholesale price, but to do so he would probably have to look over the town and sell in small quantities to the different retailers. The Cultivator, not being engaged in that business, could hardly agree to take off the hands of producers at quoted prices. Users must remember that until they have a large co-operative organization which will deal with buyers at first hand, that they can not expect the ordinary ruling price in the market. The selling of produce is a trade in itself.

Picholine Olives.

I have an orchard with nearly a hundred olive trees, of which some are Picholines. Can I graft or bud them to some good kind? Will they do well? What is best time to bud or graft? Where can I sell the Picholines, as I have a heavy crop?—H. J. L., Pomona.

We assume you mean the Redding Picholine, which is an exceedingly small berry, very rich in oil. The true Picholine is a larger and better fruit. They may be budded next spring similar to the budding of an orange tree, or the ordinary cleft top graft is sometimes used for making over olive trees. If the stocks are large, put in two or several scions. Bark grafting is also often practised, and may be used at any time when the bark will slip, or especially April or May. Where carefully done, the failures will not exceed 5 per cent. We presume the olives may be sold at any oil mill and are quite sure the American Olive Company of Los Angeles will handle them for you.

Cement Water Tank.

I wish to build a cement water tank about 8 by 10 by 6 feet high. Should the bottom or floor be built first or the wall? Can the bottom be put in after the casing is removed? Does it need reinforcing with steel rods? Is 8-inch wall sufficient for that size? What size outlet should be necessary to get the pressure for irrigation, distance of the tank from the garden being 50 feet, elevation 15 feet?—O. Z., Petaluma.

The Concrete Age Publishing Company at Atlanta, Georgia, published a little booklet, "Concrete on the Farm," which should be of value to you. In general, we may say, build the sides first on good solid foundation; then level floor of the tank and put on a two or three-inch concrete floor; after which cover with a float of almost pure cement. Reinforcing with steel or wire would make it stronger, and in that case 8 inches would be abundantly thick for the size you mention. Not knowing the size of stream you wish for irrigation, we cannot tell as to size of opening at the tank, but if simply for hose use on garden truck would imagine a 1-inch opening sufficient. A 2-inch opening would surely give you better pressure, however.

Books and Fruit Growing.

Please furnish me with names of books and where they can be obtained, furnishing information regarding culture, pruning and care of citrus and other fruits, especially dates and grapes. I want a book that will be of benefit to a man who has little experience in fruit growing. Will you advise fall plowing between fruit trees for mulching purposes?—O. A. D., Phoenix.

The best book we know of written in a general way as you suggest will soon be off the press. It is written by Prof. E. J. Wickson of the California University, and is entitled "California Fruits and How to Grow Them." Most of its information

Mayer Leading Lady

THE CORRECT SHOE FOR STYLE, EASE AND GOOD WEAR

You could never hope to buy a more stylish or serviceable shoe than the "Leading Lady." It is right up-to-date in appearance and fits the foot perfectly from the very first. Besides being stylish and comfortable, the

Leading Lady

wears much longer than most shoes. It is so well made that it lasts twice as long as the average shoe, and will retain its shape to the end.

Why buy inferior shoes when, with the same money, you can get the "Leading Lady?" Your dealer will supply you; if not, write to us.

Look for the Mayer Trade Mark on the sole.

FREE—If you will send us the name of a dealer who *does not* handle Leading Lady Shoes, we will send you free, postpaid, a beautiful picture of Martha Washington, size 15x20.

We also make Honorbilt Shoes, Martha Washington Comfort Shoes, Yerma Cushion Shoes and Special Merit School Shoes.

Angle Lamp
The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT. GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Send for Illustrated Catalogue with Prices

Boesch Lamp Co., (Est. 1869) 1135 Mission St., San Francisco

$16.30 buys this handsome six-hole Nickle-Trimmed Cast Range direct from the Manufacturer

without high shelf. With high shelf, just as shown in the cut, $19.97; large oven, six cooking holes, best quality of iron. Burns coal or wood. Handsome nickle trimmings. OUR TERMS are the most liberal ever made. You can pay after you receive the range. You can take it into your own home and use it 30 days. If you don't find it exactly as represented, the biggest bargain you ever saw you won't have to keep it.

Household Department

THE CALL.

I'm weary of toiling and worry,
Of living the strenuous life;
I tire of the struggle and hurry,
The tumult, the noise and the strife.
I long for a sight of the flowers,
The song of the murmuring stream;
I long for the forests where hours
Will pass like the woof of a dream.

I'm weary of plotting and scheming
That lay out the map of the game;
I'm tired of make-believe seeming
That oft is mistaken for fame.
I long for the lake and the river
That shimmer and shine in the sun;
Where leaves in the warm breezes quiver
And rest is the goal I have won.

I'm weary of sepulchres whited
That harbor but mouldy old bones;
I see childish toil unrequited
And listen to widowhood's moan.
I long for the day to be dawning
When right with the scepter shall reign;
When men at Mammon's feet fawning
Will rise to their manhood again.

I'm weary, but duty is calling,
And only the sluggard will shirk;
The tasks that are set are appalling,
But honor says simply, "Go work!"
I long for the woods in their beauty,
But over the call that they give,
I hear the stern calling of duty
That bids me be worthy to live.

—Farmers' Tribune.

FAITHFUL UNTO DEATH.

THIS is not really a story at all—only the simple relation of some facts about a dog that possibly may not be without interest.

On the outskirts of the little city of Buena Vista, Va., near the head of the valley, lived a farmer, with his wife, two sons and one daughter. This was in 1894. The farmer's name—I think I do not incorrectly recall—was Robinson, and his cottage stood on a level bench of the hills, near the Blue Ridge Mountains. His land sloped back to the pines and sassafras bushes that covered the foothills. Robinson owned some cattle that ranged on the indifferent pasture of his poorly-fenced farm, wandering from field to field through gaps and numerous breaks in the old fences, made of rails and brush.

He owned a large dog of uncertain breed of a black and reddish color, but which seemed to possess some of the instincts of the shepherd. This dog was sent out in the morning and in the evening at milking time to bring in an old, spotted cow that belonged to his master. This seemed to be his sole occupation. At other times he lay about the house, or slept under the stable shed in uninterrupted composure.

Through the lower part of these pasture lands ran the track of a narrow-gauge railroad, built for the purpose of conveying ore from the red hematite iron mines in the mountain gorge a mile away, to the iron furnace operated in the industrial portion of the town. One morning the engine and loaded cars, coming down from the Robinson farm, caught this old spotted cow in a short railroad cut which was made in the grading of the road through the pasture, where she at the time was grazing with other cattle, and striking her with great violence, cast her dead and mangled body upon the rocks on the right-hand side of the road. The sons of the family related to me how the dog showed signs of inconsolable distress when the carcass of the dead animal was taken away and rolled over the cliffs below.

In a few weeks Robinson got another cow, and the dog, that was growing rather old, renewed his occupation of driving in this second cow. But he had learned a new lesson—and a sad one. It was that his charge was in danger from the railroad. This faithful dog stayed with that cow day and night, following her from place to place, lying in the pasture near by when she was grazing, or standing under the shade trees with other cattle. And when the engine and train of cars would come thundering by, the dog would leap up and bark, and if near the track, would always drive the cow further into the field away from danger.

This continued for two years, the dog being fed by his appreciative master as often as the cow was milked. Often the days and nights were cold and damp on the north side of the mountain, and the snow covered the ground. But this made no change in the dog's faithfulness. One evening the dog lay down during the milking, drowsy and complaining to himself in sighs and little uneasy murmurings. The cow was then kept in the stable at night, the winter having set in. But in the morning he followed his charge back along the path that wound to the upper field around the mountain spur, and came in again the next evening as the sun lowered to the western hills, yet with weak and trembling step. The men thought he had distemper, and determined that they would not let him lie on those cold hills another day, even if he had to be chained at home. But when the morning came again they went out to work and forgot him. Not so the daughter of the household, a girl of seventeen, who saw and pitied his feeble condition, and went early to the shed where he slept, made an enclosure of empty barrels that lay conveniently near, and placing them upright all around him, thought he could surely not get over them in his weakened condition. She then went about her morning tasks.

That day had been ushered in with rain and snow, and along the paths in the field were little snow-drifts that the winds had swept down from the exposed hill-tops above. At noon the girl went again to the barn to see how the dog fared, but, to her surprise, found his bed empty. She knew well where to find him. There was no other place for him but with the cow. But, thought she, well enough to go, he will certainly be well enough to return, and the day wore sullenly away. He did return, and for several days following he hung on the heels of his inseparable companion.

It was late in November when Robinson put a collar around the dog's neck, and with a small rope tied him in the shelter where he slept at night and gave him food and water. He refused to touch his food, and with his last strength gnawed the rope, and some time during the day was gone again to the mountain side. They saw his tracks along the path toward the pastures, but the prints did not show that he ran with the freedom and strength of earlier days. They were close together and uneven, and here and there were traces of his having lain down from sheer weak-

Light and Cook with COLT TRADE MARK Acetylene

Refering to our illustration of Lighting and Cooking apparatus in the issue of the Cultivator October 15, page 351, we wish to show you this week, what a comfort and convenience this wonderful and cheap light is to the entire family. The light is simply sun-light itself, and therefore beneficial to the eye and health.

The Piping and attractive chandeliers can be installed at little expense while the generator is simply a machine, so simple that any one can install it. It needs no attention as it generates gas automatically.

If you will simply let us know your name and address, we will mail you free, our new 44 page catalouge, with fine description of the simplicity, economy, convenience and safety of Colt Acetylene.

ness as he climbed the winding path.

The father and daughter went into the fields and called the dog for a long time, but in vain. Finally, going across the pastures to the side of a sheltered slope, where the cattle often lingered, and where the cow that day had fed, they found his dead body lying among the withered grasses and sassafras sprouts of the neglected land. The wind among the pines on the mountainside moaned a requiem over the old watchman dead at his post of duty.—Country Gentleman.

CODFISH RELISHES.

The following codfish dishes were recently given by a subscriber of Country Gentleman and are well worth repeating.

Codfish Patties.

Pick codfish into shreds, freshen and bring to a boil, add a thickening of corn starch and cream or rich milk and let cool. Line patty pans with rich pie crust. Fill these with the cold codfish, cover with whipped cream and brown lightly in a hot oven. Serve with tiny pickled cucumbers or slices of lemon.

Masked Codfish.

Stir four tablespoonfuls of softened butter into two teacupfuls of mashed potatoes, add a teacupful of very finely- shredded codfish, moisten with cream and season with pepper to taste. Butter a tin basin, press in the potato and fish mixture, cover with bread crumbs and beaten yelk of egg and bake fifteen minutes.

Another Way.

Bake the mixture (after making the top smooth) ten minutes; turn out on to the perforated plate of the fish kettle. The bottom of an old tin basin perforated with nails will answer. Cover with beaten egg and crumbs and drop into a kettle of very hot fat, enough to cover, and fry brown.

Codfish A La Mode.

Shred finely enough codfish to fill a large coffee cup, add two tablespoonfuls of vinegar, two tablespoonfuls of melted butter, a little pepper, juice of a lemon, and bind with a well-beaten egg. Form into cakes with the hand, roll in beaten egg and cracker crumbs, and fry in hot fat; drain on brown paper and serve with a sauce of cream slightly thickened with corn starch and seasoned with a little lemon juice.

Timbales.

Break macaroni into short lengths and cook tender in salted water; add a well-beaten egg, grated or chopped cheese to taste, and season with melted butter. Smear a small basin thickly with butter and dress with bread crumbs. When the macaroni is cold, fill the mold, but leave quite a hollow in the middle. Have some codfish prepared as follows: Shred and cook in water a few minutes, drain and season with cream, butter, and a pinch of caynne. Fill the hollow in the center of the basin, spread the top with a layer of the boiled macaroni and bake half an hour. Garnish with blanched celery leaves.

Escalloped Codfish.

Freshen, pick very fine, thicken with milk, cornstarch and beaten egg. Into a buttered dish put a layer of codfish, then one of bread crumbs, season with pepper and butter, and moisten with the sauce, and alternate, having the top layer crumbs, and bake slowly one hour, then brown the top.

Codfish Cakes.

Take equal quantities of shredded codfish, mashed potatoes and boiled beets, finely chopped. Bind with a beaten egg, form into flat cakes, and fry brown on both sides in a spider with a liberal greasing of pickled pork fat. Garnish with small, crisp slices of pickled pork.

Fish Chowder.

May be made on the back of the stove on washing, baking or ironing day. Crisp half a dozen thin slices of pickled pork in the bottom of an iron pot; remove, chop fine and return to the kettle. Put in a layer of freshened, shredded codfish, a layer of sliced onions, one of sliced potatoes, crackers, sliced peeled tomatoes; sprinkle with summer savory. if liked, and season with celery salt and pepper. Alternate these layers until the pot is two-thirds full. Nearly cover with cold water and boil slowly about an hour, or until the ingredients are soft. Watch that the water does not cook away and the contents burn at the bottom of the pot. When done, turn into a tureen or deep vegetable dish, pour over a teacupful of cream, or half milk and half cream. Serve with finger lengths of inch-wide toasted bread.

Codfish Gruel.

This is a good dish for supper. Freshen a tablespoonful of very finely-shredded fish. Stir in a teaspoonful of cornstarch, add a teacupful of boiling water, and simmer until the flour is well cooked. Add cream and a little butter, and serve with toasted crackers.

WAX FINISH.

A subscriber recently requested a formula for a wax finish which was given. We now notice another in Gleanings in Bee Culture as follows:

The beeswax finish is made by mixing turpentine and melted beeswax in such proportions that, when cool, the mixture will be in the form of a thin paste. The proportions we used were about three parts of turpentine to one of melted wax, by measure. While hot it should be thoroughly stirred. If not thin enough when cold to spread nicely, more turpentine without heating may be added.

This paste is spread upon the woodwork, covering it thoroughly; then with a brush the surplus is cleaned off, after which it is immediately rubbed down with a rag until a glossy finish is secured.

Nothing but pure beeswax will answer the purpose. The slightest admixture of paraffine will spoil it. The finish, while glossy like varnish or that of hard oil, has a rich, smooth appearance that brings out very clearly the grain of the wood. Indeed, to our notion it is richer and more in keeping with modern finishes than the old-fashioned glossy cheap varnish look. It does not begin to cost as much as hard oil or any other varnish. While one may use a filler, yet it is hardly necessary, as the effect is very pleasing without it. Indeed, the wax itslf acts somewhat as a filler as well as a finish.

As to woods, it looks nice on any wood, either hard or soft, although the effect is much richer with an oak or a maple than with the yellow pine. If we were to use the latter we would advise using what is known as the weathered-oak stain, then apply the beeswax finish.

I didn't come right out either way, but simply looked wise and kep' still which is a great common way of gettin' up a reputation for wisdom.—Josiah Allen's Wife.

Salt, used as a tooth powder, will harden the gums, preserve the teeth and sweeten the breath.

Hay.

Somers & Co., say:

Shipments of hay to the San Francisco market continue to decrease, the total for the week just ending amounting to 2670 ton. Although this decrease has been occasioned somewhat by the prevailing car scarcity, yet the tendency of owners to hold in anticipation of higher prices is also largely responsible for present light shipments. The demand throughout the interior is steadily increasing and it is becoming more and more apparent each day that many districts are very short of hay. Therefore although the market here is not especially interesting and the demand still rather light, yet it is now generally conceded that the entire State's supply as compared with the entire demand is none too great, but that on the other hand a material shortage may be noted before hay grows again.

For the first time for a long period arrivals by water have exceeded in quantity those by rail. The Bay and River warehouses are being heavily drawn upon and unless the car shortage is relieved at an early date our entire stocks located on the water will be exhausted.

Citrus Market

LOS ANGELES, Oct. 28, 1908.

This is the last week of the year in orange shipping circles. Nov. 1 begins the new year and already the navels are going while Valencias are finishing the old year. As we write the last cars of Valencias are being shipped.

Butte county got in ahead and has the honor of first shipments of navels. Tulare county is a close second and is now shipping several cars of navels. Next week will see Tulare county sending in several cars. Thanksgiving trade will be well supplied.

Mr. Sprott of the Tulare County Exchange informs us that fruit in that section is of better quality this year than last. It is both sweeter and of better appearance.

Valencias are closing at good prices, better than earlier. Prices of navels are not yet fixed and it would be only guess work to predict.

Shipments.

Shipments of citrus fruit to date since Nov. 1, '07 aggregate 29,402 of which 4885 were lemons.

To same date last season 27,450 of which 3468 were lemons.

QUERIES.

Continued from Page 427.

would apply to Arizona conditions. A good book on citrus culture is written by H. H. Hume of the Florida Citrus Experiment Station. Either book can be supplied from this office at $2.50.

Ashes.

A subscriber last week inquired as to quantities of ashes per acre which might safely be applied to orange trees. We now note that on sweet potato land valuable results have been secured by the application of from 1200 to 2000 pounds per acre. On citrus trees we should imagine half that amount would probably give good results.

Chestnut Troubles.

I am a grower of chestnuts, but fail to keep the kernel of the nut from decaying—that is, after picking same. I do not spray with any mixture, but have tried drying, both in ovens and by the sun—both proven failures. Please give me a remedy, if any.—B. B. C., Vacaville.

This query was referred to Prof. R. E. Smith of the Pathological Laboratory, and he writes: "I cannot give any definite answer to your subscriber's inquiry regarding the decay of chestnuts without further information as to the nature of the trouble. Perhaps if he would send on some specimens of the affected nuts we could determine the cause of the trouble."

If our Vacaville subscriber will send samples of nuts to Prof. Smith at Whittier, he may give us the needed information.

Vetch With Hay.

A grain grower of San Diego county inquires if advantage may be had by growing vetch with barley. That is, will it aid in gathering nitrogen so the barley will be benefited, or will it take moisture from the soil needed by the barley? His idea is that it will be of advantage and at the same time make an excellent addition to the hay. As wheat takes longer to mature than barley, would wheat work in better with the vetch? Again, would peas be better than the vetch with either barley or wheat? This was referred to Mr. Neff, who writes:

Planting vetch with barley will not benefit the present crop of barley, and be of but little benefit to any succeeding crop if cut off with the barley. It will make an excellent addition to the hay if sown early, but will take moisture from the soil just as barley does. Barley will be better than wheat with vetch where the rainy season is short, since the wheat takes longer to mature, and with scant rainfall all might dry out before either was matured.

Peas would not be as good as vetch because it is not as drouth resistant.

Do Irrigation Work---Quicker and Easier

For Leveling Fields—For Cutting and Clearing Laterals

The photo is from an actual field-scene in New Mexico, where a 20th Century Grader is leveling seed-beds on the great truck-farm of Herman Blucher. He says: "Your 20th Century Grader has no equal for land-leveling, seed-bed making, ditching and for all kinds of irrigation work. I have reduced my force one-third since buying this machine." The

20th Century Grader

weighs only 600 lbs—light and handy—and is easily handled by one man and two horses. It is all steel and malleable iron. Price very reasonable. It pays for itself in one season. If your dealer hasn't it ask for name of nearest agent. Write now for new free booklet with large cuts showing every part.

Baker Manufacturing Co.
281 Dearborn St. Chicago, Ill.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Please address all questions that are to receive gratuitous replies through these columns to California Cultivator, 115½ N. Broadway.

All communications to Dr. Whittlesey direct should contain a great big dollar.

Injured Teat.

I have a cow, with one teat, which I suppose was snagged about one inch from the end of teat, and she now has a calf one week old and can not milk, as the milk runs out on the ground, and when I try to milk it comes out on the side where hole is. Please advise me what can be done.—J. P. G., Valencia, Santa Cruz Co.

I doubt if anything can be done as long as she gives milk, except to put up with the inconvenience. When she is dry, the edges of the hole can be denuded of skin, and the raw surfaces brought together, sewed with wire, all parts thoroughly sterilized, and covered with adhesive plaster. A perfect union should take place.

But this can not be done while milking, as the dressing will all come off and the milk work through from inside.—R. T. W.

Spavin.

Will you please inform me through your paper if a bone spavin or a bog spavin can be cured? How long it will take to cure it? The cost, and if the horse can be worked while being cured? P. M., Artesia.

Bone spavin and bog spavin, while similar, are not identical. Both are usually curable and it often takes several months. While it is possible to cure them and work the horse at the same time, the more rest they receive the quicker and surer is the cure.

The cost is usually $10 for the operation of firing, and that may be all the outlay necessary.

There are so many things entering into the question of curing a spavin that it is impossible to put it into an article like this. If you will take your horse to Dr. Whittlesey's office, he will be able to tell you more on five minutes' examination than in a dozen letters and answers. There would be no expense for the examination.

Summer Sores.

I have a seven-year-old mare which had small boils come one above the other below the knee, which have turned into large running sores, and the limbs are both swollen, one very bad and a trifle lame. Some horsemen here call them cancers.—W. W. G., Imperial.

The sores you ask about are not true cancers, but are about as hard to heal. They are known in different parts of the world under different names. In Europe the common name is summer sores. The little seeds which you will find in them are about the size of millet seeds. In the warmer parts of the United States they are very common, and require close attention and persistent treatment to produce a cure. The first thing is to destroy them deep enough to be below these little seeds mentioned above. This can be done by eating out with such drugs as arsenic or corrosive sublimate, or burning with a white-hot iron.

Either of which is a little dangerous for a novice to do. If you use either of the drugs mentioned, they may be rubbed into the sore dry, and the whole left until a large "core" falls out. If the iron is used the same result follows in about the same time.

But the danger lies in overdoing the job and making the sore larger and worse.

After the "core" has fallen out, a solution of formaldehyde, two ounces in one gallon of water or that proportion should be used. Saturate a piece of cotton and bind on the sore, change three times a week.

I have a preparation which I use in the hospital with good success for eating out these sores, there being no danger whatever.

For $2 enough will be sent to treat them all that is required.

COMBINATION.

S. H. Church who for the last 5 years has conducted a poultry supply store in Los Angeles has associated himself with Aggeler & Musser Seed Co., successors to the Johnson & Musser Seed Co., of No. 113 North Main street, Los Angeles. This firm has been enlarging their business and has added a poultry supply department taking over the stock of Mr. Church, and the agency of lines which he handled. These lines comprise the Petaluma Incubator and brooders, Midland Poultry food, Steinmesch chick food. Drs. Hess & Clark stock and poultry remedies and Swift's beef scraps.

This is a move that ought to prove a winner for the Aggeler & Musser Seed Co., as the poultry supply and seed business naturally go together. Mr. Church who will have the management of the new department is a thorough seed man as well as being familiar with the needs of the poultry industry, and will be pleased to see all of his old customers and friends.

More Money For You

Greater productiveness of trees—larger, cleaner, and finer fruit—more money. Isn't that fruit growers' reasoning? Nothing will contribute to this end more than effective spraying. And **Effective Spraying** can best be attained with

Bean Magic Spray Pumps

Effective spraying means **High Pressure Spraying** and till the advent of the Bean Magics a high pressure could not be maintained with a hand pump for any length of time, on account of the body-racking effort needed to operate it. The Bean patent spring divides the work between the two strokes of the handle and works against only one-half the pressure shown on the gauge and saves exactly one-third the labor.

Our illustrated catalog No. 21 describes ten sizes of hand pumps, and contains much valuable spray information, and formulas. Catalog No. 22 describes Power Sprayers. Both books sent free. Write for our special offer; state number of acres and kind of fruit.

Pedigreed Vines and the Young Vineyard

A Paper Read Before the Farmers' Institute at Davis

By MRS. MINNA E. SHERMAN, of Fresno, California

WHAT shall I plant is usually the first question asked by the new arrival in the fruit growing sections of California. The nursery man's catalogues pile up and everything that is recommended is marked with a cross until enough has been selected to plant a county. The fact that each variety of fruit requires somewhat different handling, different styles of boxes and ripens at a different time is overlooked. A mixed fruit farm should be balanced up or the work is never done. The man that is wise will look around before deciding on his plantings and visit the successful men of the neighborhood.

Not Accidental.

Success is not accidental in fruit growing and the successful man has something to show why he has won out. The common mistake the new comers make in California is to regard the older residents as "moss backs." The giddy talk of the great profits, reeled off by the real estate man, upsets the new arrival, just the same as it makes the older fruit grower's head spin, to listen to the tales of one tree, or vine that produced so many pounds of fruit one year, multiplied by a hundred to give the tons produced by an acre; then, by the hundred acres. The multiplication is good, but trees do not produce in that ratio, or a million or more of us would be too rich to be fruit growers.

The leading men in the growing of fruit in California are men of brains that could do well in any other business. Then, for practical work we must visit the successful men of the neighborhood, find out what they are doing, and why they prefer certain varieties of fruit. In many parts of California any fruit will grow and give good crops. Even when this is the case it is not wise from a business standpoint to try to grow anything different from your neighbors. The locality has a reputation as a producer of certain fruits and the markets look to that locality for that particular fruit.

Regular Helpers.

The railroads provide cars to handle that fruit and the packing house help have been trained to pack it in good acceptable shape.

The attempt to be the only packer of one kind of fruit in the neighborhood means that the packing crew must be broken in every year to the work; this means a large per cent of unskilled labor, and poor packing. In every neighborhood there are holders of vineyards and orchards that have sunk large sums of money by planting unsuitable varieties and kinds of fruit. A case in point is the extensive planting of the olive tree in the Southern orange belt, where few have proven profitable. In the San Joaquin the olive tree is very profitable. They are beautiful and bring thought with a touch of romance. The magic brush of fancy of the Bible writers has given them a place in the world's literature. The dove returning to the ark with an olive leaf to signify that all was peace after the terrors of the deluge. Yet it will not do to build up to a commercial standpoint a vineyard or orchard on the poets, though there is no reason why the mind may not be busy with all the poetry of the world as part of the daily rounds of the ranch work. The poetry and the pictures are there to make part of the life.

The raisin industry was young, but an assured success when I planted the first vineyard down in the barley stubble field. On the ranch when first purchased were four acres of old vines, old enough to be on the wane as far as fruitfulness was concerned. These vines were of many European varieties grown from the early importation of cuttings. Some of these varieties showed particular adaptability to the Fresno climatic conditions and soil. Malagas, Muscats, Rose de Peru, Tokays, Hamburgs, Bergurs, Palominos, Ferazagoes, and Zinfandels. In this little vineyard we received the first lessons in pruning that, afterwards, proved to be all wrong, as the vines were pruned all alike without regard to the variety.

The general subject of grapes falls into three groups formed by the use that is ultimately made of them, raisin grapes, table grapes and wine grapes. I have been working with raisin grapes, and table grapes for 23 years, and sometimes I feel I know a little about their growth and needs. Every year, however, comes new insight into better ways than the old routine.

The Vineyard.

There is the individuality of the vines themselves. Personality is not as marked in plant life as in animal, yet it is an element that must be considered. Each vine and tree is a separate individual, but as the vines in a commercial vineyard are grown from the cuttings and not from seed, each vine is the direct part of the parent vine. Changes, therefore, in its character as a fruit bearer come from external sources.

The choice of cuttings for a new vineyard should come from a vineyard that is vigorous and of high productiveness. Haphazard taking of cuttings from the brush pile is surely a poor way of increasing the yield of fruit. Going back further still, have you ever thought how we have handled ordinary vineyards? We imported vine cuttings from Europe and planted them just where we pleased without regard to former conditions—heavy land, sandy land, dry land, wet land, no matter so the cutting was in the ground. Too many vines found a burial place; naturally a few vines fell into fertile soil and did well, while others merely cumbered the ground.

What did we do next? Why, we pruned them to suit our fancy and, again, many good varieties were pronounced worthless because we did not understand their nature. A few table and raisin varieties we have at last come to a reasonable degree of understanding of their habits of growth and have made them fairly profitable. The next step of importance to be taken, if we are to raise profitable vineyards, is the selection of the mother plants. This is called pedigreeing of vines. The muscat can be greatly improved by intelligent selection of the vines, producing good crops of early sugaring grapes. The time of ripening can be brought forward two weeks, for there are vines in our vineyard that show 24 per cent of sugar year after year between the 12th and 17th of August. A whole vineyard of like early ripening fruit would make raisins many years by the first of September.

The Malaga grapes ripen over a period of five weeks and vary from a rich amber-tinted berry full of sweetness to a grape of sickly greenish hue and sour enough to make any fox declare it is indeed sour grapes to give them to any one.

Varieties.

The Emperor, Cornichon and Tokay vineyards form another group. If the grapes from these vineyards are closely examined as they come to the packing tables, the diversity of form of berries, shape of bunches and coloring will be seen to be very great. In many vineyards the culls are heavy enough to make one give the grape pickers specific instructions to send in only merchantable fruit. Just how much is rejected the grower does not realize. It will pay you one season to send all the fruit through the packing house and see for yourself the losses that are made yearly. It will trouble you at first. I felt the first time I discovered this leak of profits, like Edward Everett Hale has said of a certain class of men. "They bear three kinds of trouble at once, all the trouble they have had, all the trouble they have now and all the trouble they expect to have."

Cheer up! there is a pleasant way out, by a little interesting work. The vines should have been culled before they were planted and then the unsatisfactory fruit would have been largely eliminated. Our first Emperor vineyard was not planted with selected vines; we found that we had four forms of fruit. Then by looking carefully, we found some fruit that was perfect. The berries were large and of tranluscent red and the bunches shapely. This surely, was the type of the grape, while the other forms were made by accidentally retarding the proper growth of the parent vines. I have an idea that when unfavorable conditions overtake a portion of a vineyard, that the undesirable type of fruit becomes a habit and is carried to the succeeding generations made from the cuttings.

Be Exclusive.

The work of selecting the vines that produced the fine fruits for at least two consecutive seasons was then begun. I found it necessary to do this work personally. I waited until the week before the pickers went into the vineyard. Armed with a pot of red paint each vine that had a good crop of fine fruit was marked with a red band. Being a week in advance of the pickers, the paint had time to dry and yet the grapes were practically in the best stage of ripeness. The next year, this marking was repeated with white paint. The using of paints of two colors was to be able to make any allowances for short crop. If the general crop of the valley was short, either year, then the crop of these vines had to be taken in a relative degree.

Some Worthless.

The vines were counted after the leaves had fallen. It was found that in a seven acre vineyard, thirty-three per cent were practically worthless as producers of merchantable grapes, eleven per cent had produced on alternate years enough good grapes to receive one mark, while fifty-six per cent had produced good grapes each year. The cuttings for a new vineyard were made from the producing vines. This seven acres of old vineyard that were marked off, at five years of age, produced a scant thirty tons of grapes counting in the culls. The second vineyard at five years of age, produced eighty tons on the ten acres. These marked, for two seasons, and the result showed that twenty-two per cent were not fruitful every year, while three per cent were worthless.

The most striking thing about the two experiments is the readiness with which beauty of color and form were secured. The vines only wanted a chance to show out the latent beauty of their fruit. The increasing size of berries depends on abun-

Save Time--Save Fruit
With the Brewster Picking Sack

A new method sack—invented and perfected by lifelong growers. Eminent orchardists pronounce it perfect. Those who have tried it say they would not be without it. Actual tests show that a man can pick twenty-five per cent more fruit with it and with greater ease.

Sack forms semi-circle about picker's body—is supported by straps over both shoulders and held tight by belt around body. The picker can thus work with ease either on ground or ladder. When full, it does not extend below the hips.

A great feature of the Brewster Sack is the patent gate (see illustration), WHICH PRACTICALLY ELIMINATES BRUISING. Simply unfasten a hook—the gate drops—and the fruit can be quickly but very gently poured out.

The sack holds as much fruit as the old style sack.

Made of double filled canvas, over strong steel frames; strong sustaining straps; practically indestructible.

Sent express prepaid to any address for $1.50.

Sierra Madre Sack Company - Sierra Madre, Cal.

We want reliable men in every locality to demonstrate this sack and act as our agents.

Third Annual

Tulare County Citrus Fair

TO BE HELD AT **Exeter, California**

December 1st to 5th, 1908

Don't fail to attend this great exhibition of Citrus and Deciduous Fruits—one of the grandest displays of orchard products ever collected under one roof.

Baseball, Football, Basketball, Dancing and many other games of sport. Five days and nights of unalloyed pleasure with music all the time.

For further particulars address

W. R. WOOD, President. **C. F. BALAAM, Secretary.**

Exeter, Tulare County, Cal.

With the Citrus Growers

WONDERFUL POSSIBILITIES.

Speaking of some of California's past fruit-growing history, and referring to the future, Eugene Germain of Los Angeles recently said in the Los Angeles Herald:

"In my judgment our agricultural development is only in its infancy; its expansion is only just beginning.

"Allowing for the fact that all our leading staples of orchard and field, ranch and garden are exotic to our soil; and allowing that their production in the main is only possible by the artificial application of water, often secured at great effort and expense; and allowing that under these somewhat anomalous circumstances the horticultural production of the state has grown to the enormous sum of nearly $20,000,000, the rural economies of California can be regarded only in the light of the most marvelous exploitation in soil products of this or any other time. For nearly half a century it has been my good fortune not only to see this development, but, in a small way, I have been part and parcel of it, contributing something toward its fruition from a packer's and shipper's point of view, rather than from that of a grower.

"Obviously, horticulturally California has made history rapidly; indeed, so much so that all of us, in the strenuous experience of our own affairs, have quite lost sight of the many important things that have happened in the past forty years; and correspondingly I am of the conviction that but few of us realize what the future will unfold. I know it is so in my case. Why, it seems but yesterday that the shipment of a few carloads of citrus fruits to Eastern markets was heralded as an event; yet today we are less surprised at the statement that 25,000 carloads go forth valued at something like $19,000,000. In 1887 I was in a small way, as things go now, shipping fruit and mid-winter vegetables north per steamer to San Francisco, the only market available. We used to hear of Fresno only as a spot on the map; now that town 'turns' $28,000,000 worth of soil products a year. Riverside in those days was unkown; our oranges and lemons came from a few groves in the San Gabriel valley and from what is now a portion of Los Angeles. The walnut, the olive, the fig cultivated spasmodically, where now they are as much a feature of the landscape and the market place as wheat or corn is in the Mississippi valley. Indeed, horticulture has crowded all other activities to the wall in this state, and by reason of values has for fully twenty years been recognized as our basic industry, affording not only a living to thousands of our citizens, but also a competence.

"And while the enterprise of our people has been the cause, nevertheless it would not have been possible but for superior natural advantages. Given a soil and climate which are inferior to none, it only remained to create our marvelous system of irrigation to make possible a horticulture the like of which the world has never seen; an industry already stupendous in its ramifications, with the geographical area of the state scarcely scratched. Prior to the advent of the Anglo-Saxon the country was practically a wilderness; now it is the seat of the most profitable soil production known to man. Its benefits, not only in a pecuniary sense, but in the light of a higher civilization and a patriotic citizenship, are incalculable. I doubt if there is anywhere a community of soil tillers that possess the intelligence and moral fiber which so thoroughly individualize the man behind the plow in California."

The Avocado

The Avocado, or alligator pear, by the way a comparatively new product of Florida so far as the average American citizen knows, has begun to show up on this market in suprisingly large quantities. Here and there along the street now you see a sign reading, "alligator pears." At least 75 per cent of the stay-at home trade did not know what an alligator pear looked like two years ago.

It looks as though the alligator pear has come to stay, if the recommendation of those who know all about it counts for anything. However, the pears must be introduced to the public and it may be that the men who make the introduction will likewise make a fortune as was done in Rocky Ford cantaloupes and even grapefruit. About twelve or fifteen years ago the peddlers sold the first grapefruit that came here for "big oranges" and the following day the housewives of New York were out looking for them with broom sticks and hatchets. Now the grapefruit, in season, is an indispensable adjunct to millions of breakfast tables.

Hickson Bros. of Miami. Fla., extensive growers of alligator pears, in writing The Packer say of the product.

"This is one of the best, if not the best, of all tropical fruits. It is the most easily digested, the most wholesome and the most nourishing. According to government statistics it contains over 10 per cent of fat and in a form that the most delicate persons can partake of it with a relish, when they cannot partake of fat from an animal source. It is an upbuilder of the system; nerve as well as muscle. It requires but little coaxing of the palate for one to become extremely fond of it.

"The Avocado is a salad fruit and is prepared or served with any and all kinds of condiments, according to one's taste. It welcomes olive oil, lemon or lime juice, the ordinary salad dressing or with pepper, salt and vinegar. The favorite way is to halve the fruit, remove the seed and skin, then cut the meat into cubes of about half-inch size and add the desired dressing.

"Another favorite way to serve the smaller varieties is to halve the fruit and after removing the seed and inner lining to serve each half in a saucer to each person, the fruit to be eaten with a light sprinkling of salt, (pepper and vinegar if desired) out of the skin with a teaspoon. We quote the following from the Tampa Times:

"'The Avocado makes the basis of a score of the finest salads that ever tickled the palate of an epicure and it has the great merit that it cannot be spoiled.

"'It welcomes olive oil and lemon

YELLOW MONEY AND YELLOW FRUIT

Are a pair that travel together in good shape in an orange or lemon grove. Especially is this true if you will plant only the robust and true-to-name

Citrus Trees

grown by the San Dimas Citrus Nurseries, the largest growers of choice orange and lemon nursery stock in the world. No branch of horticulture offers better inducements in the way of profits, nor is there one more alluring to the person contemplating commercial fruit culture. For the past twenty years we have supplied the leading growers with their trees, and hope to number many more among our friends and patrons. Orders now being booked, subject to future delivery. Send for book on

"The Citrus Fruits: Historically, Horticulturally, Commercially."

The Coachella valley will shlp 150 cars of onlons this season.

juice alike, extending a friendly welcome to mustard and pepper sauce. But the best way to enjoy an Avocado is to secure a fine specimen, just ripe enough to yield gently to a pressure of the thumb, which, if applied to a baby's ear, would make it look up at you wonderingly, sit on the kitchen steps, split the pear in halves, lay aside the beautifully ugly seed, tenderly scrape out the inside lining, arm yourself with a teaspoon, a lemon and a trifle of finely ground salt.

" 'Squeeze a modicum of lemon juice into the globular cavity, sparingly of salt, gouge out gently a heaping teaspoonful of the meat, place in the mouth and let it dissolve under pressure of the tongue against the teeth, swallow the resulting paste unctuously and with thankfulness.

" 'Then, when the delicious impression upon the sensory nerves has begun to fade, repeat the operation, and so on until you have nothing left but the skin.

" 'Half a good sized pear is enough. It may be taken before and after and with meals. The taste is good, the effect is good, the only necessary precaution being to eat slowly and not too large a quanity.'

"This is a fruit that all physicians should look carefully into, on account of its nourshing and digestible qualities."—The Packer.

NEW IN IRRIGATION.

The University Farmers' Institute has a ripe field on the subject of irrigation of deciduous fruit trees in Central and Northern California, some of the growers in those sections using the crudest and most wasteful methods. One grower irrigated his peach orchard by plowing one shallow furrow on each side of each row, turned on the water and cut it out at intervals, allowing it to flood the ground under the tree and in the spaces. The ground was allowed to dry out and crack open, no attempt being made to retain the moisture by cultivation. Another peach grower was running the full irrigation stream in one ditch through the orchard and letting it out at intervals to flood the ground. Some places the water stood a foot deep and in others it was only run over the surface. It was suggested that it would be cheaper for them and better results would be realized by plowing deep furrows at intervals so the water could not get out of them and as soon after irrigation as possible run over the furrows lengthwise with a harrow with a 2x4 timber wired between the two front rows of teeth. This will drag in enough dry dirt to cover the wet bottoms of the furrows and stop the greater part of evaporation at once.

When furrowing out shovels are used on a riding cultivator, a handy device and a cheap one, is a heavy wagon tire cut and bent in the shape of a W and fastened to the back of the cultivator frame with the two points of the W pointing backwards. If attached so that center and upper or front part of the W shaped iron follows between two furrows, the dirt will be dragged into the furrows from both sides, filling them almost full at one operation.

There is scarcely any realization of the amount of loss by evaporation by allowing the soil to dry out before cultivation. It is shown very plainly by comparing the appearance of the surface early in the morning with the same surface in the middle of the

Deciduous Fruit Culture

By J. W. Mills

YELLOWS.

The "yellows," which swept so like fire over nearly all peach sections of the East a few years ago and later subsided somewhat, is reported now to be returning. An eastern exchange in speaking of it says:

Undoubtedly "yellows" is by far the most serious disease that attacks the peach, indeed it is far more dangerous than all the other diseases put together, and it is more virulently infectious. In that respect it may be compared with cholera or yellow fever as they affect the human race.

Think you, if some well authenticated cases of cholera or yellow fever were detected that there would not be a hurrying and a scurrying of the medical authorities and boards of health, etc., and the severest measures would at once be taken to stamp the disease out? It is true that yellows in the peach does not seriously attack the health of the people, although cases are on record of persons affected with this disease, but it does seriously menace the pockets of the fruit growers and threatens the destruction—for the time being—of a most important industry. And yet, with the exception of a few wide-awake persons, the majority of fruit growers are going on their way with their eyes tight shut to their danger. It is not too much to say that there are but few orchards between Stoney Creek and Beamsville, above or below the mountain, entirely free from it. And east of Beamsville much the same is true. And still, as I have said, the greater number of growers are fast asleep as regards this matter. More than that, in many cases where the inspector has gone through and marked the trees some time ago they are still allowed to stand undestroyed, a danger of the most deadly kind to the trees of their owner and his neighbors. Another point of much importance here crops up. The inspectors as a body no doubt do their best but some of them do not seem to be thoroughly conversant with the symptoms of yellows, for I have been in orchards where trees have been marked by the inspector, and rightly marked, and other trees in the same orchard just as badly affected have not been marked at all. It will, therefore, pay every peach grower to learn the symptoms for himself, and where one or two trees have been marked by the inspector, to very carefully examine all the trees near by.

During the last few years, a great many new men have gone into fruit growing, who know nothing about "yellows" except as a name, and one can find some excuse for their neglect in this matter, but there is absolutely ought to be thoroughly alive to the no excuse for older growers who danger, being equally careless and indifferent and they deserve severe condemnation. What would you think of men who knew that cholera was present in their families and yet did nothing? You could scarcely conceive of such a case. Yet yellows is just as dangerous to the peach as cholera is to people. It is true that yellows is a most insidious disease and is sometimes present in the orchard, one or event two years before experienced men can detect it. The first indication is generally in the central head of the tree. Usually the leaves there are large, but when yellows first attacks, they begin to set much closer, say about three leaves to the inch. The next sign is that the inner leaves near the ground show a rolling up and at first a tinge of yellow, and the next year there will be an occasional specimen of prematurely ripened fruit and then what is termed "pennyroyal" ripening. Water sprouts also start from the main limbs. By the time the disease shows on the fruit, it has been in existence for some considerable time and it is then quite easy to detect. The fruit ripens prematurely and shows red streaks all through it and the bees sucking the pieces of this fruit, if allowed to ripen, help to spread it from tree to tree. At this stage the fruit is quite unfit for consumption.

The only remedy for yellows is, immediately on detection, to pull out and burn up and get all your neighbors to do the same. For my part, if I had trees in my peach orchard that I knew had yellows, I would not delay a minute, but dropping all other work, would pull out and burn at once. Do not drag the brush from infected trees out through the orchard and let it touch other trees. If possible burn up the tree or trees right where they grow, but if that cannot be done, cover the brush over with something as you take it away. From the wide way this disease is spread through the peach belt and also from the fact that it is making its appearance in quite young orchards, it looks very much as though the nurserymen—quite unknowingly—have been propagating from pits taken from diseased trees.

PEDIGREED VINES AND THE YOUNG VINEYARD.

Continued from Page 435.

ant water supply even in the selected vines.

Land for a young vineyard should be selected in regard to levelness, ease of irrigation and cleanness from weeds. Land infested with weeds that are pests, and Johnson grass, Bermuda grass and morning glory had best be left to plowed crops for a few years. The soil for a vineyard does not require to be of great depth, three to eight feet being sufficient. With good sub-irrigation a vineyard will rarely require surface irrigation after the third year. An old alfalfa field is not as good soil to plant young vines in as a grain field. The alfalfa field soil is denser and has been shaded, until it is no longer friable enough for vine growth. The heavy long roots of the alfalfa rot slowly and the young roots of the newly set out vines are not in healthy surroundings.

The condition of the land before planting a vineyard can be readily examined by digging a pit to hardpan or to the underlying soil. The top soil shows the action of light, then the more dense soils come, that lie below the regular plow lines. If the soil has been well cared for the upper portion will be friable, moisture not too far from the top and not wide cracks. A poorly cultivated soil will show cracks where the moisture has passed into the atmosphere. These great cracks in the soil indicate poor mechanical condition in the soil; they show that it needs humus, in the form of barn yard manure or of a green cover crop. On much of the

land that has been grain farmed for years it is perfectly safe to consider that it lacks humus.

Level the land carefully and throw the checks up broad and straight enough to be used for wagon ways. This work should be done early to have plenty of rain fall on the land. Plow deeply and harrow it smooth before starting to plant. When land has to be leveled, it is well to do the work the year before planting the vineyards, and grow a winter crop of cereals and a summer crop of corn. The soil will then be well aired and in fine condition to receive the young vines. When land has to be leveled, and must be planted the same season,

WHERE ROLLS THE OREGON.

the scraped over places should have particular attention, being top-dressed with a heavy coat of manure. After a rain or two turn the manure ten inches under the soil. After the vines are planted top-dress these spots again with manure. A spot of land that has been leveled and not given special care will remain less fruitful for years, and the vines will show shorter wood growth than the rest of the vineyard.

A LESSON IN APPLE PICKING.

In the matter of picking receptacles the greatest diversity prevails. Buckets, baskets and bags have each their devotees and I know one man who provides his pickers with coal scuttles. The latter, however, suggest pouring a little too strongly, and such rough treatment is not thought of any more than with eggs. Buckets and baskets are awkward to handle compared with bags. A lining of burlap greatly improves them although it should not cause any relaxation of care in placing the fruit in them. Bags are open to the objection that the fruit in them is easily bruised if the bag brushes against a limb or ladder.

In many styles of bags it is unhandy to remove the fruit without pouring, and to overcome this difficulty a bottomless bag has been devised, which allows the fruit to roll from the bottom when the chain is released. The average picker, however, could never withstand the tempation to stand up and let them shoot into the box the moment the foreman's back was turned. The best picking bag that has come to our notice is the apron bag. It is cheap, being made of a heavy grain sack; hangs in the most convenient position for filling, leaving both hands free; is so shallow that the first apples can be conveniently laid in without dropping and yet holds all the wearer can readily carry and, finally, can not be emptied by pouring unless the picker stands on his head.

For hauling to the packing house the fruit is usually emptied into apple boxes and the ease of handling these can be greatly increased by having a slot for the hand cut in each end. Any box factory will slot them for a trifling sum. The slots also serve to mark off these boxes sharply from the others and prevent fruit being packed into them, more or less soiled as they are. Some growers have boxes especially made for this purpose, one-third larger than the common size and of heavier material, with ends higher than the sides to permit stacking without danger of bruising the fruit. These boxes should be hauled to the packing house on a spring wagon or, if the distance is not great, a stone-boat is admirably suited to the purpose.—Field and Farm.

Scraping out the dead wood and filling the cavity with cement will be the means of saving valuable apple trees that otherwise would soon be destroyed by rot.

BEN DAVIS' MARRIAGE TO WESTERN BEAUTY.

Ben Davis was a Wealthy Mann. He was married to a Western Beauty by the name of Caroline R. June In Early Harvest by a Fameuse Dominie by the name of Gideon. They journeyed by Horse to Lowell where they were seen by a Northern Spy by the name of Jonathan Baldwin, who was drunk on Smith's Cider and who lives on the Saint Lawrence tributary to the Wolf River. He was Stark mad and saw Stars in midday which made the Maiden Blush. An Arkansas Black Senator, Peter Longfield by name, a perfect Paragon, was sitting on a Stump near a Smoke House eating a Golden Sweet Winter Banana that was very Early Ripe, bought at Cooper's Market. He saluted the Lady who wore a Red Astrachan and carried upon her arm a McIntosh fit for a Bismark or even a King and upon her corsage she wore a Bellflower imported from Ontario by a gentleman by the name of Rolfe Vandevere, who is employed by the Duchess of Oldenburg, wife of Alexander Wagener, esq., nephew of the late Walter Pease Primate of Langford, whose marriage to Lady Henniker, daughter of the York Imperial, and author of Ivanhoe, was such an Opalescent failure.—Green's Fruit Grower.

The honest fruit grower who puts up good fruit and gives honest-sized packages does not need to look up a trade. It will come to him.

TREES
Season 1908-9
Order Now for Future Delivery

If your trees are purchased from the Fancher Creek Nurseries they will be true tc name well developed, with good roots.

FOR 25 YEARS we have been engaged in growing reliable nursery stock. Our thorough knowledge of every branch of the business makes it possible for us to raise and deliver stock that meets the demands of this country, and gives satisfaction to growers.

Last year we did the largest business in our history. This year our stock of

Deciduous, Citrus and Ornamental Trees, Grape Vines and Rose Bushes

is more complete and better than ever.

We are sole propagators and disseminators of

IT'S PENNY WISE

Policy to set out a good tree, costing good money, and then let the sun burn the bark or the rabbits gnaw it, when for $1 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow street, Los Angeles.

The recent fair at Escondido was pronounced to be a complete success.

The Vegetable Garden

THIS MONTH.

Strawberry plants may be planted though as a rule the greater planting is later. Onion sets may be planted. Silver skins and Australian Browns are winners. Crystal wax is a favorite with many. Prices have been low for the past few months. They can't always rule. Celery, Cabbage, cauliflower and Parsley plants, Horseradish and Rhubarb roots are planted. Of course lettuce is always in order.

Burn the rubbish. It harbors insects and fungous troubles. You may lose a little humus by burning it but clean it up.

Spade in plenty of stable manure for the spring planting plats. The intensive culture of the garden demands rich, friable soil. It's money back to work up the soil before the planting.

METHODS OF GROWING.

From the address of Mr. H. S. Hazeltine before Winterburg Institute.

But some of you may be asking yourselves. "How can I grow a first class product which will meet the requirements of the trade?" If you will permit me the time I will take up a few of the most important subjects which interest the farmers of today. It will not be necessary to go into details relative to growing and packing celery, as I believe we are pretty well versed and united on the matter. I think more attention should be given to preparing the soil for a crop, and to irrigating. Black Heart is also an interesting subject to talk about; crop rotation should be studied more closely than it is; and in order to start a discussion I will give my views on the four subjects:

Properly Preparing Soil for Celery.

Beginning in the winter as soon as the land is available, level it to a grade, as it is necessary to irrigate frequently and this cannot be done successfully without an absolutely perfect grade, so that the water will run from one end of the field to the other without pooling up. This done, plow the soil shallow if it be of a clay nature, or a deep discing will do if the soil is peat or of a sandy sediment nature; then seed to some leguminous plant, the California burr clover preferred, owing to the enormous amount of humus it furnishes in addition to the nitrogen. It is a natural crop for our soil and climate, starts quickly and makes a vigorous growth during the cold weather. If the soil is of a clay nature and insufficiently drained, I would recommend sowing rape, as it sends out a tremendous mass of roots, penetrating the hardest clods, thereby rendering the soil mellow, porous and sun fertilized, ready to produce a crop. The crop thus grown should be turned under about thirty days prior to transplanting the celery, plowing the soil at least ten inches deep. Follow this with a light irrigation to settle the soil, and hasten the decay in the clover. A much better stand is secured by two irrigations, and by so doing the soil is thoroughly settled, clover is decayed and the soil will hold the moisture much longer, giving young plants a good start before the moisture goes down.

Irrigation.

Celery should be irrigated with great care, as I believe more celery is ruined each year by careless irrigating, or lack of same, than by any other one cause. Taking the crop from the time it is transplanted, an even moist soil should be maintained, allowing the water level to lower as the celery advances; in other words, keep the roots of the celery going downward seeking the moisture. This will have a tendency to make a strong, healthy root that will support the plant a great length of time without irrigation, and this is what we want, as too frequent watering causes the roots to spread out on the surface to be torn up by the cultivator, and dry out if neglected a few days, when in need of water. Under these conditions the main root is very small and nourishment is furnished almost entirely by surface roots. This might be all right if a quick growth was desired; but in California the prime object is to grow a plant that will hold a reasonable length of time after maturity, as market conditions are not always favorable and many other difficulties arise in which it is necessary to hold the crop in a semi-dormant state, so to speak. The tile system of irrigating and drainage has proved to be the best, as absolute control of the moisture is possible under adverse conditions. A main line should be laid around the field with laterals every sixty or seventy feet and connected at each end. Gates should be installed at frequent intervals in the main, so that the water can be held at any depth desired in the summer. Artesian wells should be connected with the main lines at the highest points in the field, and when necessary to raise the moisture it is a matter of only a few minutes time to turn on the wells and close the gates, as desired, and wait for results. By this system any portion of the field can be irrigated independent of the other. This system is, of course, used for drainage during the wet season.

ASHES FOR VEGETABLES

Wood ashes contain potash, phosphoric acid and lime, all of which are useful in the growing of vegetables, writes Prof. R. Harcourt, O. A. C., Guelph, in Canadian Horticulturist. The ashes are usually valued more for the potash which they contain than either of the other two constituents, for vegetables require potash more than lime or phosporic acid. On clay soils, lime has an additional advantage in that it liberates potash from the soil. Thus the ashes will supply potash direct and lime will liberate it from the insoluble combinations in the soil. If you can buy wood ashes that have not been leached, and of which you know something of the history, for five cents per bushel, they will make a very cheap form of fertilizer. For vegetable crops you may safely apply these at the rate of a ton to a ton and a half per acre.

A NEW WAY TO KILL GOPHERS.

Dig down into their runways and put a few lumps of calcium carbide in the same as used to make acetylene gas of. It comes in small cubes one-eight to one-quarter inch square and is not explosive.

After putting it well down into the hole, pour in one-half to one bucket of water and fill the hole quickly with dirt or sod. Firm down with the foot so that the gas cannot escape. Mr. Mole will go out of business instanter. —Exchange.

The Ornamental Garden

THIS MONTH.

BULBS which were not planted last month should be planted at once. Freesias especially should be planted now. Gladioli which were taken up early and dried may now be planted for late winter bloom. The main part of this crop, however, should be planted later. Lilies should be planted, Stocks, Pansies, Roses, Cineraria and Primula are set out. November is the month in which Rose and Carnation cuttings are made.

Spading and making ready of soil for rains and for later planting is timely. Stable manure spaded into the soil is now beneficial. Sweet peas, a big lot of them, may be planted.

Don't let the ground get too dry. The heavy rains haven't come and soaked the ground, and while many shrubs and even annuals are where the demand for water is not great yet the mistake is often made of letting them become too dry and they suffer.

Watch the poinsettias, and if danger of frost appears, protect them. They are a wonderful flower and worth a little extra care. They may go several years without injury, but when the frost does threaten it is worth while to protect. It is but a few weeks till they are in full bloom, so the protection will be but for a short time.

LANDSCAPE OF THE FARM.

A GREAT many, if not a majority, of farms are of forty acres or more. The problem of making the farm an attractive place is best solved at the beginning. The common method is to build house and out-buildings close by the highway, along which every comer chances to run. The result is that the opportunity to beautify the farm-home is thus lost at the outset. If one has only a city lot to build upon, this crowding to the front is not only permissible, but necessary. But with forty acres of background the squeezing of the home into the extreme corner shows lack of imagination.

The farm view from its buildings should be one of magnificent distances. Two things may aid in securing this. First, if there is an elevation anywhere upon the farm the homestead, other conditions being satisfactory, should be located there. It is an inspiration of incomparable value to the farmer in his few leisure moments to stand at the door of his home and look down upon the domain which he is yearly conquering. The nearer such an elevation is to the center, the better the opportunities for securing fine landscape effects, and if there be no such elevation upon the farm, a few acres near the center should be chosen for the home inclosure, from which a driveway should connect it with the highway by the shortest route compatible with regular laying off of the fields.

The reasons for having barns and implement houses at this point are especially sound. It is the point of vantage from which all portions of the farm are of easiest access which means much in economy of time, and of wear and tear upon machinery going to and coming from the outlying fields. On two different farms in New York state, one of twice the size of the other, it was found that the position of the farm buildings near the center of the large one resulted in less loss of time going to and coming from the fields than in the smaller, where the buildings were inconveniently located.—Leslie F. Paull, Colorado Agricultural College.

IRRIGATING BY GRAVITY FROM SAN JOAQUIN RIVER, SAN JOAQUIN COUNTY.

NEATNESS.

What is it to have neatness characterize our surroundings? Is it to have a pile of empty tin cans and broken dishes lying by the side of our back door step? Is it to have heaps of ashes reposing on our lawn? Or is it to have rubbish cumbering the yard, filling up the angles of the fences or piling against the very buildings themselves? Neatness means cleanliness in our surroundings. Fortunately this cleanliness is not difficult to secure. To be frank, it is quite a simple matter if a little forethought is exercised at the outset and vigilant care is afterward maintained.

Then, too, neatness has its own reward. When garbage is thrown about indiscriminately it may become a menace to the good health of the household. Then there is an economy of labor in having a definite place or receptacle in which to deposit all waste matter. When this is provided one is not obliged to wander about wondering where to cast the worn-out shoes, the broken cup or the stale bread, so that they may be disposed of for the time being and be somewhat out of sight. All this necessitates a loss of time and energy and is no small tax on the mind.

Then neatness is essential if our surroundings are to be beautiful. Nor is the effect of beautiful surroundings on the character of our lives of any inconsiderable moment. Cleanliness of surroundings exerts no small influence in moulding clean characters. So we should not neglect this simple matter of neatness. On the contrary, we should strenuously cultivate the habit on our farms. It will repay our efforts bountifully in ways of healthfulness, convenience and beauty.—Green's Fruit Grower.

BEWARE THE TREE PEDDLER.

Now is the season when the tree peddler is abroad in the land, and all sorts of inducements and arguments will be made by him to sell stock. He will usually sell anything demanded, and it will be well for the purchaser to fight shy of him. It will take several years before you can find out whether you, as well as the trees, have not been sold, and if he has sold you stock which you did not want you will have lost so many years of valuable time, so many crops of fruit, as well as the money and time expended. This does not apply to the agents of well established nurseries, for these cannot be classed as tree peddlers. It is good advice to all who are contemplating planting trees to get them from some well known, established nursery, one with a reputation and one which is likely to be in existence for several years to come. In such cases, if trees are not what they are represented as being, the purchaser has a source of redress. But more than this, such establishments are especially careful to keep up their reputations, which is their stock in trade, and they cannot afford to misrepresent or substitute. Even in such cases mistakes may occur but they are rare and not intentional, whereas the peripatetic peddler has but one object, the selling of stock, and he will sell anything desired, whether he has it or not.

THE FRONT YARD.

The neatest yard now has a smooth grass sod kept closely mown, while the flowers and shrubbery are restricted to the sides and rear. This not only renders the lawn more easily kept than when there were flowerbeds to mow around and trim and trees or shrubs to dodge, but it is really more restful in appearance.

TWO CYLINDER ENGINES.

The Temple Pump Company, of Chicago is the pioneer in the manufacture of the Multiple Cylinder Gasoline Engine. The Master Workman, a double cylinder Gasoline Engine, was the first in the field. Now, the whole course of progress in the making of Gas Engines is towards the multiple type, engines of two, four, six and eight cylinders being made. The Temple Company are now manufacturing two and four cylinder engines for general farm use.

The advantages of the two and four cylinder engines for the farm are: Economy in the use of fuel, greater certainty of continuous running, quick and easy starting, less cumbersomness and adaptation not only for stationary use but for portable and traction use. Sooner or later the need of an engine for traction purposes as well as for stationary will be felt by every agriculturist.

This is the fifty-fifth year of the Temple Pump Company.

MILK AS FOOD

THERE seems to be a number of subscribers interested in making the milk they are selling conform to the required standard of butter fat. Where the milk is below the standard this is commendable but when it is too rich, reducing it, I confess, I think bad practice. I do not like the laws that start people to altering a natural product. Human laws have to be carefully framed or they fail in their restrictions. One of the amusing instances is the law making all the milk conform to a standard per cent of butter fat. The national one is low enough, 3.25. Nearly all the milk sold to the city trade is higher than this, for the housekeepers will patronize the milkman that furnishes milk rich enough to make a little cream for breakfast coffee. Wherever there is a legal standard the milk men at once start in to make the milk no richer than the minimum requirements. The legal minimum is always the result of any attempt to regulate a food supply of any sort.

Standardizing Milk.

This had better be called debasing milk, for not a single one of the five letters I am attempting to answer says one word about adding butter fat to the milk they are selling. It is all how much skim milk must I add to reduce the butter fat to the legal minimum requirements. A late number of the Pacific Dairy Review gives the following as a rule:

The number of pounds of skim milk to be added is found by multiplying the number of pounds of original milk by the test of the original milk, dividing results by test desired, and subtracting the number of pounds of original milk. For instance: How many pounds of skim milk must be added to 70 pounds of milk testing 5 per cent to reduce the test to 4 per cent? Applying the above rule, we multiply 70 by 5 and divide by 4, subtract 70, and have 17½ pounds as the number of pounds of skim milk to be added.

The business principles of the world all seem to work away from the Golden Rule. Today, instead of having things as good as they can be made, we simply try and have them as cheap as we can and still sell them. Educating the consumer seems to me the best way out of it. In food products the women do the buying and the need of educating them as to the food values is greater than the need for some other things now included in women's education.

Wrong Standard.

The proper standard for milk handling would be to make it unlawful to add or subtract from the milk. Then test the dairies for butter fat and sell the milk according to the price of butter fat. The unit of butter fat prices could be fixed from time to time by the dairy men themselves. The fertilizers we use we purchase on the unit plan and the farmer does not find it hard to estimate the prices he should pay on this basis. Enforcing this selling rule would require no more testing and inspection than the present rule of watching that the milk does not fall below a certain standard. In feeding invalids, excepting those with wasting diseases, the lower per cent in milk is preferred as being more digestible. Children, too, thrive better on a three and a half per cent milk than on the richer milks. The protein is better balanced with the fat and heat making materials than in the richer milk.

Good Milk.

There is of course the great necessity of having milk clean if it is to be wholesome. There is, also, the need of healthy cows. The heavy, forced feeding of grains is not only expensive, but, as they render the cows more liable to garget and udder troubles, may not make the milk so wholesome as if the cows were fed on more simple and natural foods. We neglect too much wheat straw, for example; this, fed with alfalfa, is fairly productive food for dairy cows. The silage comes in; and where a silo is thought to be too expensive, then surely some cow peas, hay, or bean straw can be secured. We in California always try to do things too quick. Do not buy cows until you have the feed for them grown on the home place.

Milk.

Really it is little trouble to keep a cow clean if it is only made some one's business to do so. Now, down South I have had the darkey children tell me they did not have time to wash their faces. In other words they had not been trained to consider it necessary. Did you ever think how many things we all do every day as a habit that we never think anything about?

It is so with the cows; start the men doing these things rightly and they soon come to think there is no other way to do it. The large cities of the East have had the milk supplied to them made clean and wholesome. The average amount used by each adult has increased rapidly. The use of milk products must increase as the price of beef continues to rise.

Cheese.

Few housekeepers realize that cheese is a heavy food and can take the place of meat; instead, it is served as a dessert. The cream cheeses of the market sometimes contain as much fat as the heaviest of butter cream. They contain often ten to thirty per cent more fat than the ordinary cream sold to the housekeeper. Now if the family put a lot of butter on the bread and then eat it with the cheese they are getting something very rich. Cheese, eaten with bread the same as meat, is rich enough to leave out the butter. When cheese is eaten instead of meat and not added to an already too rich meal it will lose its present reputation of being indigestible—M. E. Sherman.

If a farmer is going to make the most money out of cows, he will be a man who follows inflexibly a right policy with his cows because it is right. Most of the time we cannot see the end from the beginning. We have to trust to well established principles. The moment a farmer tries to cheat a cow out of what food she needs in order to do her best, that moment that farmer begins to dig the ground out from under his own feet. It is so everywhere in this dairy business. The real reason for doing the right thing by the creamery, by our separator, by the cow and by everything we touch clear down the line, is because there is no other way to do and come out right. And if we don't come out right, "what shall it profit us?"

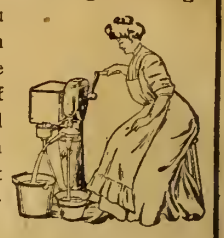
Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Dairy Hints

To produce that high scoring butter—you must insist on cleanliness; the proper care of your herd; and that the cream be in the best possible condition.



Tubular Separators

will assist you in your enterprise because they are easy to clean, due to their simplicity; and they produce a rich velvety cream in an unwhipped and unchurned condition.

Their simplicity, durability, efficiency and originality of design are recognized everywhere, by everyone.

Catalog 260 describes them fully, sent free upon request.

Brawley is now the location of a United States Weather Observing Station.

True Type of the Holstein

CONSIDERABLE public comment appearing in the agricultural papers upon the type of Holstein-Friesian cattle is very properly directing attention to the subject of the true type of the breed.

The breeder, who, for one moment in his pursuit of higher fat percentage in the milk, forgets type, is doing incalculable damage to the future of the breed.

The true type of the breed is very accurately delineated in the scale of points. It is to be regretted that illustrations of typical specimens are not used to illustrate and emphasize this description.

Change of environment of this breed from the lowlands of Holland is doubtless effecting a very slight change in the bony structure of the Holstein, tending toward greater finish or refinement. Aside from this natural process, it is very doubtful whether any improvement can be made or should be attempted. The Holland type is the result of centuries of selection and environment, and it has distinguished these cattle in all parts of the world. With it has come the marvelous and profitable production or yield, the characteristic tendencies of powerful digestion and perfect assimilation of food. These characteristics, derived from the Holstein, have been important factors in the foundation stock of the Shorthorn and Ayrshire breeds, and of many of the Continental off-shoots.

In America it was the Holland type that by its productive power directed the attention of agriculturists toward this breed, and it is safe to assert that an examination of the great majority of remarkable yields will show, to those having means of access to photographs or descriptions, the close adherence to the Holland type in all these wonderful animals. Large size in the Holstein is the first thing to impress the casual observer, and its importance should never be disregarded.

In defining pure bred Holstein cattle, this fact was duly set forth by the founders of the Herd-Book Association, in these words, which should never be forgotten, no matter what may be the yield in milk or its fat percentage, viz.: "Pure bred Holstein-Friesian shall be held to mean and refer to only those large, improved black and white cattle, etc." (Art. 4, Sec. 5, By-Laws of H.-F. A. of A.)

Scientific investigation in this country, particularly in Wisconsin, has confirmed the wisdom of the early breeders in thus defining the type of the breed as "large," for the large cow of any breed is uniformly the more profitable.

With large size as the recognized predominant characteristic of the breed, aside from their beautiful black and white color markings in perfectly defined patches or spots, the next general definition relates to the general conformation of the animal. There are three definite types, described as the milk and beef form, the milk form, and beef and milk form.

The average form of this breed and that toward which conscientious breeders are directing their efforts to maintain and improve, is the milk and beef form.

It may be further emphasized, that the milk and beef form, describes a cow of the wedge form, with shoulders moderately thick, deep and broad, crops well filled, barrel well rounded, loin and hips broad and full, and quarters straight, wide and full.

To this form of these cattle is due their extraordinary constitutional vigor or vital force, and it affects all their relations to their food, care and productions.

The milk and beef form is not accompanied with the angularity of appearance, the light shoulders and chest, and the comparatively light quarters of cattle of the milk form.

The future of the breed will be greatly endangered by those, who, from one consideration or another, the combination of pedigrees to attain large average records or fat percentages, or by neglect of proper feed and care in the early life of the animal, are led to the mating of animals of other than those of large size, and possessing the milk and beef form.—F. L. Houghton, Battleboro, Vt.

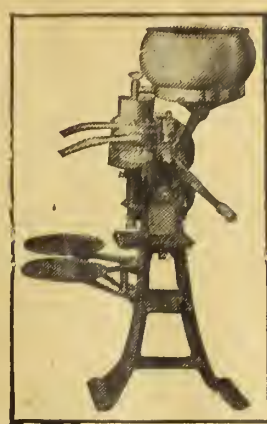
THE OX AS A WORKER.

In the choice of motive power, allow me to suggest the ox. The horse leans forward to pull and even helps himself along by bobbing his head, he jerks a load out of a hard place by plunging bodily against the collar, stopping and lunging again; he strains through a hard place and then starts suddenly forward at his release; he works himself into a lather; and you, if you are the right kind of a person, cannot help feeling for him and assisting him with inward stress and strain

The ox does not bob a horn. He simply journeys, and the load goes along. When he comes to a tough place his pasterns do not bend down; he does not squat to pull; he does not pinch along on the toes of his shoes; he seldom blows, and he does not know how to sweat. He does not exert himself at a patch of woven soil and then hurry up when he is past it. The chain becomes stiffer and the yoke sits solider to his neck, and that is all; there is no sign of effort. The earth may grit its teeth and crunch as it swallows the plow, but the ox stalks on his way. With the share deep or shallow, or lifted entirely and hanging from the axle—whether he is plowing earth or air—it makes no difference to him. His most ponderous task is still himself, and he heeds no incidentals.

He is out for a stroll; he does not allow work to interfere with the even tenor of his way. His tendons are rigged to his outstanding rump bones like so much spar and tackle, and he goes along by interior leverage; inside his old-woman hulk is the necessary engine work, and he will neither go slower for this thing nor faster for that. There is much about him besides his disposition that is self-contained, he is the antithesis of the automobile. To ride on his back is a cure for the indigestion; to ride behind him is a rest for the mind; a course of ox is an antidote for the ills of the times.—Charles D. Stewart in the Atlantic.

Analysis made of sugar beets grown in Imperial Valley has proved satisfactory.



TIME TO BUY CREAM SEPARATORS NOW

There never was a better time to buy the best of Cream Separators than right now.

The advantages derived from the use of the good Cream Separator are greater in the fall and winter than at any other time,—when the cows are old in lactation, the loss of butter-fat is otherwise greatest, and butter prices are highest.

Likewise are the advantages of the superior DE LAVAL separators greatest over imitating separators when the milk is hard to separate and the weather cold and variable,

In every case a DE LAVAL separator, of suitable size, will surely at least save its cost between now and July 1st next, and go on returning 100 per cent. per year on the investment for twenty years to come.

The agricultural and particularly the dairying outlook was never brighter and more promising.

WHY NOT BUY NOW?

PRODUCE MARKETS.—Los Angeles Market; San Francisco Market; Citrus Markets, 454, 455.

THE ELECTION.

Election is over and the "country is saved." The best man has been elected, at least that is what a majorlty of the voters of the country say, and we doubt not that all will join in the sentiment. The administration of William H. Taft will be a success and will be supported not only by his own party, but by a vast majority of all other parties. In other words, he wlll be President of the United States and will not be a partlsan President in any sense.

The vote is emphatic, giving Taft and Sherman 129 votes to spare in the electoral college.

It is most satisfactory that the question is settled. Business will now be resumed with more vigor and the "wait till after election" talk which has throttled all advance is dead.

ARIZONA FAIR.

The territorlal fair of Arizona will be in full swing at Phoenix next week. It begins on Monday and ends on Saturday. Mlning will doubtless be most promlnent, but Arlzona agriculture is becoming more and more of a factor as will be shown at the fair. As usual "Captive balloons" and things and "many other unique contests" are features but it is possible an agricultural fair cannot be held without these fake affairs.

In any case the Arizona people do not prostitute and debase the ceremony of marriage to draw a mob by having a "wedding in a lions den."

CARE IN PICKING.

Tulare county citrus growers are wrestling with the problem of greater care in picking oranges. Owlng to the campaign made in Southern California by G. Harold Powell and hls assistants the growers there have as a rule been converted to a plan of greater care in handling the orange from the time when it leaves the tree until in the car. It was a hard fight because of course there are some growers who are always in open rebellion on any change or plan suggested, especially if that change contemplates a slightly increased expense account.

The same campaign seems now to be necessary in Tulare county. Some growers have rebelled because they feel that to employ labor by the day and insist on extreme care that there shall be no punctures nor abrasions of the skin of the orange will make increased cost not justified by the returns. That this policy is short sighted will in time be realized by those same growers but they must first realize that to ship perfectly sound first grade fruit calls for no greater freight or packing expense and at the same time will command an advantage in the market which will bring to the grower's pocket far more than it takes out.

Mr. Powell has shown so plainly the effect of this careless handling and has drilled it into the growers thoroughly, and still better the growers who nave taken care in picking their fruit have received so much better returns, that the fight is fully won in most citrus sections. For instance, Mr. Rumsey at Riverside carried his experlment to the extreme and picked and packed his fruit so carefully that the extra cost to him was twenty cents per box over the former method. Twenty cents per box means from $70 to $80 per car added cost. No grower wishes to throw this amount of money away. But when Mr. Rumsey receives from one hundred to two or three hundred dollars greater price over other fruit equally as good as his, excepting in that one factor of care in picking and packing, the wayfaring man should not have to be very bright to learn the lesson.

The hard working grower who spends much of his time in the grind of the daily work and reads little, requires a great deal of argument to convince him that these changes are not to the advantage of the large grower and that he is being worked by some scheme wherein he is used to the advantage of others. But in this matter of care in picking and packing the fruit every orange grower in California should join most heartily with their leaders and insist that at every turn the oranges shall be handled as carefully as possible.

GREEN ORANGES.

The papers of Florida are making a campaign against the early shipping of Florida oranges. The Farmer and Fruit Grower of Jacksonville is carry a series of cartoons in its effort to discourage the early shipping. One of these cartoons, entitled "Worse than the White Fly," shows a large insect with the head of a man labeled "The Early Shipper." In one hand is a sack called "The Market," in the other the nippers clipping off the green oranges. Another, entitled "Short Sighted," shows the early shipper reading the newspaper on which is printed "Oranges should not be shipped until thoroughly ripe and sweet as it injures the reputatlon of the Florida oranges and brings low prices." The man is engaged in holding the paper very close to his eyes in the endeavor to read it, but is remarking "I can't see it at all." Behind him on the wall is the advertlsement of the "Common Sense Optical Company," calling attention to its "good judgment" glasses. "Looking for green oranges makes many growers short sighted. We recommend the above glasses to one and all.". The campaign ln Californla has recently not been so strong against the practice of early shipping. In fact, we do not believe the fruit has been shipped so green in color as formerly. Recent plantings have been made in sections which have given earlier ripenlng and more sugar to the frult than did the original orange planting communities of Southern Californla. A few cars will probably be shipped before the holiday season, but those who are shipping these maintain stoutly that these are sweet and well colored and not colored by belng allowed to heat in the car in transit.

GOOD ROADS.

The Department of Agriculture at Washington has just issued Bulletin 338 entitled "Macadam Roads." It is a booklet of only 40 pages but has a fund of information regarding road construction which is timely and should be of value to every rural community.

There has at times prevailed a feelng amongst the farming class that the agitation for good roads is more in the interest of the automobile or pleasure seeker than of the producer. Our method of hauling products to market over roads rutted and filled with chuck holes has been continued so long that we have settled into the method of considering our present style of roadways so fixed that there need be no change. The farmer seldoms stops to figure the difference between the cost of hauling his crops to market over a smooth roadway and the roads as they now exist. The dlfference in cost is because of the heavy pulling over the poor roads and as well breakage and wear on harness and wagon. When we can awake to the fact of this loss we will be glad to tax ourselves for this great lmprovement.

At the same time it is not a question entirely of our lack of understanding of the advantages from these improvements, for it must be confessed that we cannot always claim at once all we know would be best for our own welfare. The means is not at hand to take up a line of road improvements such as should have been in this state. Los Angeles county has taken the greatest step forward of any county of this State in voting bonds to the amount of $3,500,000 for road improvements. It must be confessed that the inspiring cause of this was not so much to benefit the farmer as to please the tourist. Neverless, the farmer will secure the benefit, and we believe the example will be such that other communities of the state will be inspired to similar or perhaps greater efforts along this line.

TRUE CO-OPERATION.

E. F. Adams, in the San Francisco Chronicle, utters a world of truth on co-operation in a recent editorial in the Agricultural page of that paper. He says:

"As our readers well know, it is the judgment of the "Chronicle" that the only way in which the existence of the typical independent American farmer can be permanently maintained is by co-operation in all ways in which it is possible to co-operate. If that is not accomplished nothing, apparently, can prevent the concentration of the land of the country in large estates, owned by corporations, unless the laws are changed so as to prevent that, and cultivated by renters as most of the soil of other parts of the world is cultivated. The economic forces working to that end are very powerful and can be resisted only by co-operative effort. But co-operation to be successful must be businesslike and not emotional, permanent and not fluctuating, and with the same observance of high commercial honor that prevails in the highest commercial and financial circles where, as between man and man, all agreements are faithfully complied with under penalty of total loss of credit, without which it is impossible to carry on modern business. No one is a friend to farmers who does not frankly state to them that in their attempts to co-operate they often come far short of that standard of high commercial honor without which no business enterprise, co-operative or other, can permanently succeed."

RAIN MAKING.

It is announced that "Rain maker" Hatfield is going to supply rain for the western side of San Joaquin valley for a consideration of $3,000 in case he wins. He failed last year but we believe this was caused by "inferior chemicals which were shipped him by mistake." But this year everything is fixed satisfactorily as to chemicals and he has located his "rain factory" at an elevation of 1900 feet instead of 450 feet of last year's experiments.

How much command Mr. Hatfield may have over the clouds and the waters thereof is a problem, but he surely has good command of some of the people of the west side when he can induce them to contract to shower upon him $3000 good hard dollars in case this happens to be a rainy season.

Agricultural Notes of the Pacific Coast

Northern California

Franquette walnuts at Santa Rosa are producing large crops this season.

Lassen county alfalfa growers have about finished the alfalfa seed harvest.

A successful farmers' institute was held at Greenview, Siskiyou county, last week.

Arbuckle, Colusa county, is shipping about 1100 head of cattle to the San Joaquin valley for winter feed.

The Gridley cannery finished the campaign shipping a carload of canned fruit every day for some time.

The manager of the Ukiah Canning Company reports a good sale for the products of that cannery this fall.

Large numbers of cattle are passing through Placerville, El Dorado county, from the reserves to winter pasture.

C. W. Mann of the United States Soil Survey is in charge of a party making tests of soil in Sacramento Valley.

Glenn county claims to be producing as fine table grapes as any section of the state.

The Earl Fruit Company has sold its immense packing house at Oroville, it being rumored the Western Pacific is the buyer.

It is reported that Luther Burbank recently shipped a full carload of spineless cactus plants aggregating in value $60,000.

Several Sacramento valley creamery operators are trying to carry off premiums at a coming California Creamery Operators' Association.

The 300 stockmen who graze their cattle and sheep on the Tahoe National Forest will hold a convention at Nevada City November 10-13.

It is promised that within the next year five big dredgers will be at work on the Feather and Sacramento rivers, putting them in navigable condition.

The barns and corrals of the Sacramento Valley Beet Sugar Company were recently threatened by fire from burning straw stacks on the property.

Gridley grape growers visiting the unfermented grape juice factory at Lodi returned with favorable reports of that method of handling Gridley grapes.

Sacramento is planning for greater beauty in the plans for its streets and parks. An effort is being made to secure the services of Charles Mulford Robinson.

In the fruit district of Winters, Yolo county, there are employed about 800 Japs and 75 white men. It is rumored that the white laborers will soon disappear entirely from that section.

The Gridley Herald calls attention to the fact that Johnson grass pest which is appearing in that section should be dealt with with a strong hand and destroyed while it is possible.

The directors of the Sonoma County Co-operative Poultry Association, a corporation, are as follows: Charles Gillett, F. W. Wilson and M. B. Mac of Santa Rosa, H. R. Rabb and R. O. Gates of Cotati.

Twenty-nine farmers at Old Cow Creek in Shasta county, who brought suit against the Northern Light and Power Company over the right to use water from that stream have won a victory in the courts.

Central California

The Armsby four-cent raisin pool is declared off.

Orange picking is now in full swing in Tulare county.

A large storage warehouse at Tulare burned last week.

Turlock has forwarded 91 cars of sweet potatoes this season.

Tulare county oranges are said to be much sweeter than last year at this date.

Lindsay is preparing to make a big exhibit at the coming citrus fair at Exeter.

There is more snow in the Sierra Nevada mountains than for many years at this date.

Recent rain over the valley caused little damage as most of the raisins and prunes are under cover.

Lindsay has appropriated and collected $500 for a display at the Tulare County Citrus Fair at Exeter.

Owing to small water supply in many streams of the San Joaquin valley fish are dying in great quantities.

The Tulare Packing Company is now seeding raisins and turning out a large number of cartons ready for the trade.

Owing to the death of many of the wild ducks of Tulare lake section the State Board of Fish and Game Commissioners has proclaimed a quarantine.

Farmers near Visalia have had difficulty in collecting claims against a Dinuba creamery and have brought suit to secure about $1000 in back claims.

A long standing suit against the Tulare irrigation district system for valuable land belonging to the irrigation system has been decided in favor of the district.

Raisin growers, headed by John Fairweather of Reedley, recently met at Fresno and discussed plans of organization in the effort for securing better raisin prices.

The early shipping of oranges from some sections which are endeavoring to get out the first shipment is being generally condemned by the Central California press.

Tulare county citrus growers are discussing methods of picking fruit and as a rule the plan of picking "by the box" has been condemned and will be discontinued.

The Tulare Grange is making a strong canvass for the Mutual Fire and Insurance Bill which it is proposed to have enacted if possible at the next session of the state legislature.

Many sections in San Joaquin county are preparing to receive the lecture train of four cars which will be sent by the Southern Pacific through that valley in a short time.

Investigation as to shipping quality of various grapes forwarded from the Lodi section have proved that grapes taken from old vines have proved better shippers than the same variety from young vines.

The movement to have all oranges of the Tulare county citrus section picked by day labor instead of "by the box" is causing some adverse comment by some citrus growers, but is unqualifiedly the best system.

Southern California

It is estimated that five hundred acres of alfalfa will be planted at Thermal, Coachella valley.

Strong winds last week prevented the work of several bean threshing machines in Ventura county.

Work has been begun on the big half million pre-cooling plant of the Santa Fe Railroad Company at Colton.

A 1000 acre tract of land is being developed and planted to orange trees at Riverside by a company of capitalists.

Carelessness with fire which afterwards burned over quite a section of land near San Diego cost the careless party $35.00.

The Chino sugar factory closed the season with a record of 14,000,000 pounds of sugar made from 65,000 tons of beets.

The last Valencias have been shipped from Southern California and the new year with its new crop began November 1.

Escondido is to have a new packing house to take the place of the one recently burned. Raisins and olive oil will be the principal products handled.

The average yield per acre of beans at Mound, Ventura county, on irrigated land was 28 sacks, while the average yield per unirrigated acre was 20 and 4-5 sacks.

The Saticoy Walnut Growers' Association has received a new bleaching apparatus from Dayton, Ohio, which will permit the use of the new electric salt bleach.

The cotton planting of Imperial valley will this season be in charge of one overseer who will give information to the various planters on methods of culture.

Imperial Valley is planning for a big harvest of turkeys for Thanksgiving and Christmas trade. That section is developing into one of the finest turkey producing sections in the state.

A government report gives the condition of the orange crop for this year at 89 per cent as compared with 92 per cent in 1907. The lemon condition is quoted at 90 per cent as compared with 92 per cent last year.

A piece of land of nine acres in the Imperial Valley was recently sold for $9000. Six years ago this same land was a small part of the vast Colorado desert and of absolutely no value. The land is on the outskirts of the town of El Centro.

The suit brought by Tim Carroll of Anaheim against the Alamitos Sugar Company for infringement in the use of the patent dump which Mr. Carroll invented has resulted in favor of the plantiff and the sugar people will have to pay damages.

Sixty thousand eucalyptus trees will be planted by the Riverside Trust Company on the lands along the Santa Ana River above San Bernardino. The idea will be not so much for wood or lumber purposes as for water conservation.

Ventura county bean growers have been giving more attention to the selection of seed for the coming crop this year than ever before. By the advice of Prof. Shaw of Berkeley great care will be observed especially to secure the seed which ripens earliest.

The Coast

Seattle quotes prices on potatoes by the ton, the present quotation running $22 and $23.

The Oregon wool output this year will aggregate 18,500,000 pounds, or a million and a half pounds under last year.

Lewiston, Idaho, is gathering together a fine exhibit of her apples for an exhibition at the National Apple Show.

Farmers who have been experimenting with cranberries at Gervias report exceptionally satisfactory returns.

One feature of the Lewiston, Idaho, Fair which surprised many was the display of corn from the Nez Perce country.

Colville, Washington, is shipping its winter apple crop, receiving at the present time about an average of $1.50 per box.

Western Oregon was recently given a much needed rain of 2½ inches which was needed to start the fall sown grain.

The farming country about Salem, Oregon, is being visited with a pest of jack rabbits, which are doing vast damage to all crops.

The state of Washington will offer a grand commonwealth wheat trophy at the Corn Exhibition to be held in Omaha December 9-19.

The Utah sugar beet crop this season is said to be a record breaker as to quantity, with quality of the beets generally running very high.

Toledo, Oregon, recently closed a three-day fruit and vegetable carnival, which was successful in showing the agricultural advantages of that section.

Owing to heavy frost in the middle of October in the Hood River section apples are dropping badly, which has never been known before at this season of the year.

One day recently on the Portland hop market 4000 bales of hops were sold. The price ranged from 7 to 7¾, and a much better tone prevails in the hop market.

The Northport, Washington, Grange at its recent meeting had an exceptionally good program and election of officers. The Grange is increasing in membership very rapidly.

A contest is on between the Oregon Grangers and the automobile owners over proposed road improvements. The grangers claim that the whole move is in the interest of automobile owners.

The Inland Empire located in Eastern Washington was given drenching rains about the middle of the month, which will be the means of saving crops which had been endangered by the drouth.

A meeting of the Oregon State Board of Horticulture was recently held at Portland in which it was determined to make a more vigorous campaign against all pests affecting the fruit industry of that state.

Walla Walla grain growers have found the season's grain crop greatly injured by vast quantities of smut, which has infested the wheat this season. A persistent campaign will be made next season to wipe out the pest.

PER 2 BUSHEL SACK **$1.90** PER 2 BUSHEL SACK

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used those machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

70c Eggs

Will they sell for that this season? Some say so. Will you get your share of this good money? More reason than ever with feeds so high that you should feed a scientifically balanced ration.

Egg-More

is not a strong tonic and stimulant, but a highly nitrogenous, concentrated Poultry Food, very rich in protein. A little fed daily with good grains will keep hens healthy, make them molt early, feather out quickly and lay lots of eggs. Have you tried it? Many have and are pleased. Here is just one:

F. W. Healy, the well-known banker and fancier of Pasadena, writes: "After hearing others praise Egg-More, I determined that if there was anything to keep hens laying through the fall and winter months, I wanted it. I bought a package of Egg-More and fed it and the improvement was very marked. Keeping on with it I soon proved the truth of your statement that 'you can't put all your eggs in one basket if you feed Egg-More.' I have raised poultry nearly all my life and for twenty years in California, but never did my hens lay so well as since I began to use Egg-More. I consider it the best egg producer on the market, and I do not intend to be without it."

You better try it. For sale by many dealers. If not by yours we will prepay freight on 12½ lbs., $1.00; 25 lbs., $1.90; 50 lbs., $3.60; 100 lbs. $7.00

Are you in the race for any of our

$50 Cash Prizes

$20 first, $10 second, $5 third, fifteen $1 each. Easily earned in an hour or more by any boy or girl, man or woman, but only one in each family, without any cost to you, and no peddling or canvassing. And to each one competing we will also give a useful article. Send postal for particulars, mentioning this paper.

West Coast Mill

707-709 So. Griffin Ave., Los Angeles, Cal.

Mammoth Bronze Turkeys

Unusual success with this years early hatched birds enables us to furnish the finest lot of breeding stock (both hens and toms) ever offered before. If you are a turkey raiser improve your flock with one of our large handsome toms raised on free range and hardened to all kinds of weather. If you are not a turkey raiser start now with one or more hens and a tom, as of all poultry, turkeys are the biggest PROFIT MAKERS. Order early as the first orders take the pick of several hundred birds. Prices on application.

After January 1st. we can furnish hatching eggs from our S. C. White Leghorns, the best laying strain in Southern California. Let us book your order now.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

A POEM OF PEACE.

There were ructions in the ranks of A. P. A.
But it scarcely could be any other way,
For so many men of brains,
have been taking worlds of pains
To evolve a perfect standard, plain as day.

So that amateurs of ordinary mind,
May instructions in its pages always find
As they plod their weary way,
toward the show-room day by day
(This the goal which every breeder has in mind.)

Yet the battles have been waged with many a wound,
Poor old A. P. A. has many troubles found
But we hope they're over now,
and the public must allow,
That the reasons for their acts were good and sound.

Many men of many minds have we in hand
Yet this truth each grumbler needs to understand,
That all bitterness will end and the love of friend for friend,
Triumph over all the chickens in the land.

Now we hope all strife forevermore will cease,
And among the A. P. A. the Dove of Peace,
Will brood o'er each warrior's rest, each one having fought his best
For the various clubs and factions West and East.

Let them differ—so does wheat and oats and corn
Differ also, yet the yokel's ne'er been born
Who'll stop raising ary one, so let Johnny stack his gun,
Leaving, —, —and—good comrades sworn.

Now let good-for-nothing outside kickers yell,
Let each member of the A. P. A. excell,
Each in doing his own part, true to conscience, true in heart,
And at last it shall be written, All is well.

Dedicated to the American Poultry Association by Mrs. Frank Metcalf.

* * *

The above Poem of Peace was written for Commercial Poultry just after the great Pittsburgh meeting of the A. P. A., which the writer attended, and the prophecy was well fulfilled by the peace which prevailed at the following meeting, all factions working harmoniously together.

It was our privilege to discuss the matter of the increased salary for the Secretary of the American Poultry Association with the late T. E. Orr a few days before he left home to attend the last meeting he ever lived to see. We urged him to accept the office again, and reap the benefit of his hard work for the good of the Association, but he said he never would accept it again under any consideration. "Why" I urged. "You took the office when the A. P. A. was deep in debt, you have so financed affairs that now they are able to pay a fair salary, you certainly should be the one to have it." "The Association can never afford to pay such a salary, and I shall go down to this meeting and fight the measure to the drop of the hat" was his quick reply. Anyone who has ever attended a meeting he took part in, can testify that Mr. Orr was a good fighter, but this time he lost, and a salary of $1500 per year was voted for the Secretary, which made the office much sought after. The result has been such as to justify Mr. Orr's fears, and it has been found that a new set of rules governing the distribution of the Association's money must be formulated.

Much was published detrimental to the re-election of the late secretary, Mr. Ross Hallock, and Grant M. Curtis, and Miller Purvis earnestly urged his re-election, in spite of all that had been said. Their wisdom, in this has been proven, whether it was intentional wisdom, or just "luck," for his re-election and requested resignation has given us Fred L. Kimmey, as acting secretary, a man we probably could have gotten in no other way, and one in whom every one of us has full confidence. We believe now, with Messers Bryant and Kimmey as the leaders, and the excellent officers in other departments, that the affairs of the American Poultry Association are in the best of hands, and that great progress will be made in the near future.

Colored Standards we must have. Separate Breed Standards have just got to come and those who love to stay outside and howl, must be brought in and set to work. It is so much easier to find fault with what others do, than to better their efforts, when it comes to the test. —Mrs. Frank Metcalf.

VERY CAREFUL.

Consider now the humble hen,
Whom oft we spurn.
She doesn't act like many men,
As you shall learn.
No pardon does she have to beg
For guesses made.
She never phrophesies an egg
Until it's laid.

The above verse, clipped from an Ohio paper, is not exactly in accordance with fact. Many hens, as well as men, are arrant liars, and often cackle loudly when no egg whatever has been laid.

How often have I found one on the nest, apparently laying, and have waited until her welcome cackle announced the expected egg, sometimes sadly needed to fill out a sitting from that particular pen. How often, O! how often, have I found an empty nest, in spite of all her "prophesies."

I believe in giving the hen full credit for all she really does do, but whether her long association with mankind has demoralized her, or whether the germ of truth is lacking in her make-up, the fact remains that all cackles do not mean eggs.

AILMENTS AND REMEDIES.

A little more elbow-grease used in keeping the premises clean will often prevent disease.

The wide-awake, ever-watchful poultryman is seldom troubled with sickness among his fowls.

A little granulated charcoal mixed in the soft food is excellent in cases of diarrhoea.

A London remedy for roup is about three drops of camphor on a piece of bread.

Dampness and contaminated ground are fruitful causes of disease. The quarters should be as dry as a chip,

High Priced EGGS

Are what all poultrymen like to get during the fall and winter; but without the very best of health in the flock and a good variety of sound, wholesome feed it is hard to get such eggs.

Nature requires that hens have a rest just prior to and during the molting period; the result is a scarcity of eggs, with higher prices, and a larger profit for those who can overcome the difficulty. The one that can get eggs during the fall will be just that much ahead of his neighbors and others who fail to do so, which in the end is the difference between success and failure.

COULSON'S EGG FOOD is the feed that will turn failure into success by enabling you to secure eggs in the fall and winter while prices rule high.

Improvements have been effected in the composition of the **EGG FOOD** during the past year, so that it is now richer in the various nutrients required by the laying hen, and is a better feed than ever before. Coulson's balanced ration poultry foods are guaranteed to contain nothing but wholesome ingredients.

"THE RIGHT WAY," our booklet fully describes **COULSON'S IMPROVED MASH EGG FOOD** and other balanced rations for poultry and gives full particulars of guarantees and directions for feeding and care of poultry from the time they are hatched. If you have no copy of it, you should drop us a line today; a postal card will bring it to you.

We have agents selling our poultry foods in nearly every town in California. If you cannot obtain what you want from your dealer, write to us and we will tell you where to get it.

Germain Seed Co., Los Angeles
Distributing Agents for So. Cal.

and the ground in the runs perfectly pure.

Those who have tried it, claim that a teaspoonful of Venetian red in a gallon of drinking water is a good bowel-trouble preventative.

There is a tendency among poultrymen to belittle the old-time advice to whitewash the interior of the poultry houses. Nevertheless, we keep on whitewashing once or twice a year, and find that it prevents dampness, purifies the place, kills vermin, and makes the houses look neat and inviting.

The best cure for a well-developed case of roup is the axe. Better lose the individual bird than endanger the entire flock. If we nip the slight colds in the bud, we need not fear the appearance of roup.

The heavy feeding of corn, especially where there is an absence of good, hard, sharp grit, will bring on bad cases of indigestion which in many ways will resemble cholera. About ninety-nine cases out of a hundred of reported cholera victims are cases of indigestion. The end is the same but the disease is not contagious.

A lousy, dyspeptic fowl is a very good representative of a cholera victim.

Wallace says that enteritis, or inflammation of the bowels, is often taken for cholera, but there is a congestion of blood about the head in cholera which turns the face, comb and wattles purple, and which is unusual in enteritis.—The Feather.

THE PEKIN DUCK

I have spent 12 years in breeding, showing and shipping Pekin ducks, and know wherof I speak when I say that they are growing in favor every day. While they are being given more room and attention in the showroom than ever before, their real value lies in the great and growing demand for them in the markets of the large cities. The Chicago market has been splendid the past two years, and to supply the demand thousands of ducks have been shipped from Long Island to this market. The Pekin will never be replaced by any other duck for market purposes, their dressing off so nicely and their size making them preferable to all others.

Pekin ducks are easily penned, a two-foot wire fence keeping them confined without trouble. They lay about 125 eggs in the Spring, and, if properly fed and cared for, 20 to 30 in the fall. As to the feed, they need a mash twice a day, composed principally of bulky food, such as the following: Bran, two parts; corn meal, one part; beef meal, or scraps, one part; mixed rather soft. This will produce eggs when other foods will not. The same mash can be fed to the young ducks and will cause them to grow very fast and also to become extra large. We have had ducks weighing 11 to 12 pounds at six months of age. For broilers it is easy to make them a good size at eight weeks of age. I feed whole corn, all they will clean up, at night, to my laying ducks. A person can figure about one-half the price secured for green ducks as clean profit.

Pekin ducks are easily raised, take less brooder heat and a far less period of time. It is advisable to raise them in brooders, as they will pay very little attention to the hen. However, they will hatch better under hens than in incubators. They are not subject to disease, like chickens, and are not bothered with cholera, roup or lice. They should have a dry house to sleep in, as they will get rheumatism if compelled to sleep on damp floors.

As to the laying-house, a good, dry shed, with plenty of litter, is good. Have a board, one foot wide, standing on edge about one foot from the wall, so the ducks can get in and out at either end, the space between the board and wall to be partly filled with straw. The ducks will lay in this space and cover the eggs, but by digging into the straw you will find the great, big white eggs, warm and safe.

It seems to me that duck culture should be given more prominence in the poultry press, as it is an important branch of the poultry business in this country.—Oscar Wells in Farm-Star.

CAUSES FOR SICKNESS.

The causes for sickness among fowls can be traced to lice, filth, no grit, over-fat, sour food, leaky roofs, lack of exercise, crowded quarters, cracks in the wall, exposure to hot suns, cold houses in winter, hot houses in summer, irregularity in feeding, damp houses and runs, not enough bulky food, impure drinking water, poorly ventilated houses, exposure to bad weather, and too much heating food in the summer.—Western Poultry Journal.

DURING THE MOLT.

The shedding of the old feathers and the growing of the new coat is probably the severest strain to which all fowls are exposed. A great many die during this process. Molting begins at the end of the breeding season. If everything is favorable they will have finished in eight or ten weeks. They do not lay many eggs during the molting season. This is the time that nature has provided for a rest. We should give them plenty of care and attention during this period, so as to get them through the strain of molting as soon as possible and with as little damage as possible. They should have plenty of green feed, also meat. A mash moistened with milk is very good. Wheat and oats are the best whole grains to feed at this time. The gloss of plumage and intensity of color depend largely upon the quality of the food that is consumed. It is possible to make the fowls molt at the time that suits the breeder best. The molting season is not the same with all hens, nor does a single hen begin at the same period every year, but usually a month earlier or later. The hens that molt early are the ones that begin to fill the egg basket early in the winter and continue throughout the winter. More diseases are contracted during this period than at any other time. The heavy strain upon the constitution of fowls in casting their feathers is much greater than one would suppose. —Commercial Poultry.

Coulson's No. 3 Condition Powder

Is just the thing for molting hens. It acts as a tonic and digestive. Keeps the hens laying longer into the molt and quicker after it. Our FREE Booklet, "THE RIGHT WAY" gives full particulars and special offer. Manufactured only by

TOO FAT TO LAY.

When asked at the Ontario Poultry Institute whether or not a hen was apt to get too fat to lay, Professor James E. Rice, the well-known poultry authority at Cornell, N. Y., stated that he could not answer the question satisfactorily, but related the following experience: "Last fall we killed all the hens in one of our experiments, and we found that the fattest hens were the hens that were in the best laying condition, and since that time we have been making very careful observations along that point. A hen to be in good laying condition must have fat in her body. The production of eggs is based upon the fact that the hen has lots of stored-up energy in her condition; and a hen cannot lay an egg until she has got fat in her body, because the yolk in an egg is about half fat and she has got to have oil there to make the best part of the egg. The fattest hens we killed were in the best laying codition, and the poorest hens we turned out by themselves, and there was not the faintest chance of their laying for two or three months." There is no doubt at all but that a laying hen must have plenty of good, nourishing food in order to keep shelling out eggs. One cannot expect a starved hen to lay eggs. Still, there is a time, especially in early spring, when it seems as if certain hens were too fat to lay. But it may be a combination of too much fat and too little exercise that causes the non-production of eggs. It is almost impossible for a hen to be too fat for laying, if she is lively and takes lots of exercise. Therefore the advice that is so often given to feed the grain among the chaff or straw so as to compel the hens to work for their food. If this is done there will never be any complaint of hens being too fat to lay.—Thomas Owen in Kansas Farmer.

Australian Eucalyptus Seed

Our Mr. R. S. Webb (a native Australian) has just returned from that country with seventeen varieties of Eucalyptus seed, comprising the varieties that have been tried in Australia, and each variety is the best for the particular purpose for which it is used, or for the particular soil and climatic conditions where they grow.

The following are some of the varieties of Eucalyptus trees preferred by the lumbermen and manufacturers of Australia:

1. Iron Bark (Panniculata)
2. Microcorys (Tallow Wood)
3. Black Butt (Pilularis)
4. Turpentine (Syncarpis)
5. Resinefera (Mahogany)
6. Tereticornis (Red Gum)
7. Saligna (Blue Gum)
8. Corynocalyx (Sugar Gum)
10. Spotted Gum (Maculata)
11. Jarrah (Marginata)
12. Sideroxylon (Iron Bark)

We will have trees of the above varieties for sale about February 1st.

General Agriculture

GASOLINE ENGINE IS BEST.

The most economical power for running silo-cutters is a gasoline engine.

It is always advisable to have the power a little too large, rather than too small.

The strain is not so great, its usefulness is lengthened, and in time of great hurry and when more power is desired, it is at hand without undue straining, and perhaps breakage.

What has been said of power applies in case of the cutter. A small cutter is continually overtaxed.

More work is required of it than was intended by the manufacturer. The strain is too great and the wear rapid.

A 14-inch cutter works very well, but an 18-inch is better. This is a good practical size for all ordinary power, but if steam power is available a 20 or 24-inch cutter is better. This latter size has great capacity, and if power is ample will cut the bundles of corn as fast as two men can throw them into the self-feeding table.

It is not advisable to buy a cutter smaller than 16 inches. An 18 or 20-inch machine is a good size and adapted to any kind of power.

If a large size is purchased at the outset, the one machine will last a great many years, and the necessity of selling a cutter for what it will bring because it is too small will be obviated.

It is best for each farmer to own a cutter. They are heavy things to move from farm to farm and a company machine usually does not receive the best of attention, as it does not seem to be anyone's business in particular to look after it.

Besides, some silos require longer carriers than others, making it necessary to readjust the machine somewhat, which is apt to cause delay and breakage.

When a good machine is properly located and adjusted for the work required, it should not be used for filling other silos.

STEAM PLOW AND COMBINED HARVESTER WORKING IN MERCED COUNTY.

ALFALFA SEED BED.

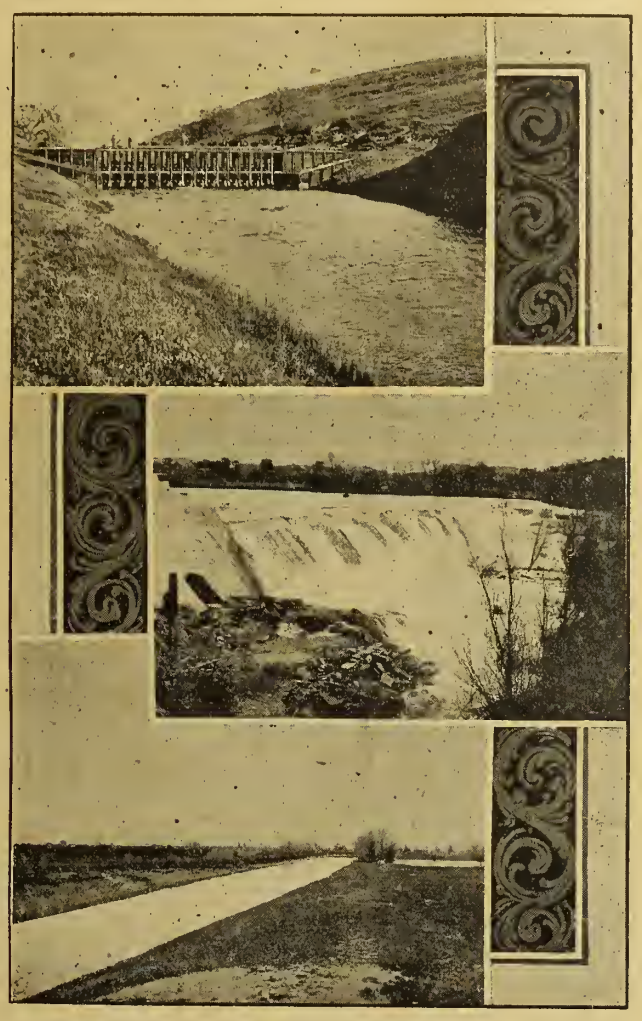
The seed bed for alfalfa should always be well settled before sowing and worked down to a fine condition on the surface. It is, therefore, never wise to plow land late, especially where a large amount of manure or green matter is turned under. If late plowing is necessary, the land should be well rolled to form a compact subsurface soil and harrowed to a fine seed bed on the surface.

Irrigation and Forestry

THE NEED OF FOREST PRESERVATION.

"In the last ten years," says the Yearbook of the Department of Agriculture 1907, "forestry has advanced in this country from an almost unknown science to a useful growing profession. In that time the number of technically trained foresters has increased from less than a dozen to over 400. Ten years ago there was not a single forest school in the country; now there are several professional forest schools which rank with those of Europe, and a score more with courses in elementary forestry whose usefulness is steadily growing. Forest lands under management have grown from one or two tracts to many, aggregating 7,503,000 acres, scattered through 39 States. The National Forests have increased from 39,000,000 acres, practically unused and unprotected, to 165,000,000 acres, used, guarded, and improved both in productiveness and accessibility. The number of States which have State forests have increased from 1 to 10, and of those which employ trained foresters from none to 11. The membership of forest associations has increased from 3600 to 15,800. Ten years ago, except for a few of the foremost botanists, European foresters knew more about American forests than did the people of this country. In Europe they were then using preservatives to prolong the service of beech ties, and so adding from twenty to forty years to their life. Here, on the other land, scarcely a treated tie had been laid, though there are now 60 treating plants, 27 of which treat ties exclusively, and an engineer who recently returned from Europe reports that both in size and mechanical perfection the treating equipment of this country is ahead of any to be found abroad.

"And yet American forestry has only safely passed the experimental stage and got ready to do something. Action, immediate and vigorous, must be taken if the inevitable famine of wood supplies is to be lessened. We are now using as much wood in a single year as grows in three, with only twenty years' supply of virgin growth in sight. Only the application of forest knowledge with wisdom, method, and energy in the next ten years can prevent the starving of national industries for lack of wood.



IRRIGATING SCENES IN MERCED COUNTY.
CANAL AND HEADGATE
MERCED FALLS
IRRIGATING DITCH.

"California tanbark oak, hitherto considered of principal value for the tannin in its bark, has been found through timber tests to be suitable for cooperage and wagon manufacture In strength it compares favorably with eastern oaks and hickory. Eucalyptus planting has been given much attention in California. The interior of one of the largest buildings in Los Angeles was finished in eucalyptus imported from Australia at $250 a thousand board feet. This tree grows very rapidly, and is especially adapted to that region. Four companies have been formed which will plant in the aggregate several thousand acres with eucalyptus. It is with this tree that the Santa Fe Railway is planting 8,650 acres near San Diego to test its suitability for the production of ties."

PATROL AND IMPROVEMENT OF NATIONAL FORESTS.

"The National Forests are constantly being used in more ways and by more people. Added experience is making possible the classification of the forests by types, with general instructions concerning the systems of cutting best calculated to secure in each type the production of the most wood of the best quality. In carrying out some of the timber sale contracts utilization is now almost as complete as in a German forest. The lumbermen, though now cutting timber under regulation on the National Forests, are competing in the market with those who cut outside—a direct argument that conservative forestry is thoroughly practicable from the lumberman's point of view.

"The regulation of the range by the Government has proved a decided success. No longer hustled from one place to another in competition for insufficient feed, stock is now brought through to the end of the summer in better flesh and with fewer losses than formerly. During 1907 improvement of the range by protection was supplemented by experimental investigations to determine how the amount of forage can be increased; how plants of little value can be replaced by others more useful; how poisonous plants can be got rid of or their effect upon stock counteracted by treatment; and to plan a system of handling stock that will result in the most economic utilization of the forage crop.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Little Peaches.

I send sample of small peaches, the entire tree bearing fruit of this size, while last year it bore a normal crop of good, choice fruit—Subscriber.

This fruit was shown to experts, who were asked if it was a case of "little peaches," a disease which is affecting many eastern orchards. It is claimed that this disease is not known in this State at the present time, for investigation of every case of this kind has shown it to be caused by some other condition. It must be brought on by some abnormal condition of soil or tree.

Mule-Footed Hog.

Some months ago you printed an item regarding the "mule-footed hog," but I have seen nothing further on the subject. Will you please tell me if there is any truth in this report?—J. S., Shively.

There is a mule-foot hog association in Missouri, we believe, but as a commercial proposition the hog has not yet passed the freak stage. It was originally claimed to be cholera proof, but this has been absolutely denied.

Tuberculosis Germs.

I wish to ask if live germs of tuberculosis are to be found in bacon which we buy from groceries or in cured meats? I wish the Cultivator would use its influence to get an act passed to have all sires of cattle and hogs in California pass the tuberculin test.—A. C. E., El Centro.

There is no danger of tuberculin germs in bacon. That is, the fact that the hog may have been affected with tuberculosis would not of itself make the meat a conveyor of the disease. But on general principles we should condemn all meat of diseased animals. There is likewise no danger of young stock inheriting tuberculosis from sires; that is, bear in mind, so far as directly inheriting the disease is concerned. Tuberculosis is not transmitted in that way. The offspring may inherit a weak constitution from a diseased sire and in that way be susceptible and later receive the fatal germs.

Sorghum.

I have three acres of sorghum which is now up about eight inches since last cutting. Would like to pasture same before plowing. People here claim it is very dangerous for cows. Will you kindly inform me what effect it has used as pasture?—J. E. P., Santa Ana.

We pasture sorghum freely. Our 21 cows have been eating second growth sorghum for over a month. We put the cows out for one hour the first day; the next day lengthen the time half an hour, and continue to lengthen it until they are out three hours. Then let them stay all day.—M. E. S.

Possibly Abortion.

About six weeks ago my cow refused to eat the bran and middlings mash that I was in the habit of giving her twice daily. Then she refused the oat and barley hay and finally refused the green alfalfa which I cut for her. For two weeks she ate very sparingly of the hay and absolutely refused to taste the mash. Then for more than two weeks she did not eat a handful of hay a day, some days eating nothing. A load of pumpkins cut up for her did not tempt her, and, of course, she fell away in her milk till all I could get was a spoonful of slightly colored water. For the last week she has been eating a small forkful of the green and dry hay, but still refuses the mash and pumpkins. She does not act sick, but of course has fallen away considerable. She is not due to be fresh till January. Can you tell me what the trouble is and what to do for her? She is too valuable a cow to lose if I can help it. Will she come back to her milk before she comes fresh?

C. L. K., Mountain View.

Are you sure this cow has not aborted and retained the afterbirth? I should have her carefully examined by some one who understands, to see this was not the case. In the meantime see if she will not eat of some of the condimented food. For one cow it will hardly pay to mix it yourself. I would buy four or five pounds and add to her bran half a pound. If her milk returns milk her, but if she has fever it will hardly do so. The symptoms are those of fever and the cause above the most probable one.—M. E. S.

Transplanting Dates.

I have some so-called date palms about 10 inches high, from the seed. Should they be transplanted to pots or set to permanent positions this fall?—J. V. B., Ripon.

We assume you mean the Canariensis, or ornamental palm, and not the one which grows the edible date. If they are in a position where they can remain until next spring we would think it advisable to allow to stand and replant at that time. If they can be taken up with small balls, so as to preserve the roots they might be taken up at once and put in their permanent position.

Various Questions.

Fruit trees planted where a large oak tree formerly stood have done poorly and many died. I am told it is caused by tannic acid. Is there any remedy? Where can I obtain Indian Game chickens? Will pomegranates and persimmons sell at a profit in the East? In buying nursery trees all one year old, should I buy the large ones? Is there any fruit tree that will do well in an old orchard where some have died out?—M. S., Vacaville.

Fruit trees seldom do well where an oak tree has stood for some time. It is caused by a fungus which affects the decaying roots of the oak. This fungus attacks the roots of other trees and sometimes spreads far beyond its original field. The best remedy is perhaps to cultivate the ground with some surface growing crop for some years until the old roots have completely decayed and the soil been brought to a better condition. Indian Games may be had of an advertiser in the Cultivator whose name appears in the Poultry Department. Pomegranates and persimmons are both sold in the East and in limited quantities will probably command fair returns. In buying trees from the same nursery, same age of root, same age of bud, we would prefer the larger to the smaller. That is, one is larger than the other, and for some reason. It may possibly not be because of any greater thrift of root, but certainly favors that belief. If one bud is younger than the other and smaller because of a shorter period of growth that is another question and the smaller bud might make equally as thrifty a tree as the larger. Of course where trees are in an exceedingly rich soil and are given abundance of water in a long growing season they may be so overgrown as to be undesirable from their large size.

It is very difficult to induce any fruit tree to make satisfactory growth when just planted in a vacant place in an old orchard. The roots of the old trees fill practically the entire place with the result that the young plant is starved to death.

Pecans.

Have pecans succeeded in California? Also please give me information regarding inspection in case young trees are introduced from Texas.—H. G., Bloomington.

Pecans are being tested out in this State and have fruited well in some sections. As a commercial proposition, however, the planting is yet very light. If you wish to introduce fruit trees or plants from Texas or any other section it would be well to write your county inspector, which in your case would be Mr. S. A. Pease, San Bernardino. He can give you full information regarding inspection requirements. Should you wish to introduce them generally over the State it perhaps would be wise to get in communication with State Horticultural Commissioner J. W. Jeffrey, Sacramento.

Replanting Orange Trees.

Please tell me, can I replant orange and lemon trees which were planted in orchard form last year and have started to grow, but are not doing well? I now have a better location. They are Eureka lemons and navel oranges.—Subscriber, Arroyo Grande.

We would not replant the orchard at this time of year, but next March or as late as May we should imagine trees of only one year's growth in orchard form could be with proper care transferred to any other section. If the soil is suitable they might be balled, which would prove less shock to the tree. However, with care they could surely be moved in any case. Your other question will be answered later.

Turkestan Alfalfa.

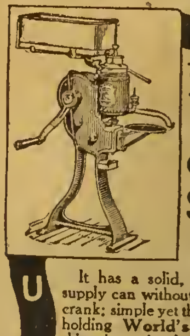
Will Turkestan alfalfa do well on sandy land or alkali land in this valley? Should it be irrigated to start it to growing? Is it as good as common alfalfa for horses?—Subscriber, Kingsburg.

Alfalfa will surely do well on a sandy loam, where it is given irrigation, and we should much prefer it to the Turkestan; or rather we know it has been tested and found entirely satisfactory, while Turkestan alfalfa has not been received with very great favor, although it has grown in the State for many years. How much alkali it will stand is a question, but it surely will not grow on strong alkali. We never have heard of comparison of Turkestan with common alfalfa as horse food.

Meningitis.

I have a colt about five months old. For the first two or three months it seemed to be all well. After that it commenced to walk on its tip toes (front feet) and is getting worse. Hoof seems hard and curved inward. Could you tell me cause and what to do for it?—B. K., Calistoga.

Yes, this trouble may come to any colt. It seems to be a form of meningitis. It often occurs in two year old horses in training and they fail to get the front feet out of the way of the hind feet, often cutting them severely. Cause, impure water and mouldy foods. I had a mare whose colts always went wrong in this way. We had the feet trimmed by a good blacksmith, thinking to cure it; also made leggings or long boots with steels in them. The present treatment we use is to put the dam and colt into a small corral, feed clean alfalfa hay and plenty of bran with a little rolled barley. Give good well water for drinking, putting a small lump of salt handy. These cases are often outgrown.—M. E. S.



The 1908 Improved
U. S. CREAM SEPARATOR
Meets every emergency in the Dairy

It has a solid, low frame; waist low supply can without the back breaking low crank; simple yet thoroughly efficient bowl, holding World's Record for cleanest skimming; is thoroughly lubricated, as gears run in a pool of oil, and has ball bearings at high speed points, making it the easiest running separator made.

Do not delay longer in the purchase of a separator and buy no other until you have seen our catalogue No. 20 sent to any address on receipt of a postal.

The Queen Colony Fruit Exchange at Corona shipped oranges and lemons during the past year which brought to the members of the organization $556,036.00. Oranges brought two and one-fifth cents per pound while lemons brought two and three-fifth cents. Officers for the coming year are: W. H. Jameson, president; S. B. Hampton, vice-president; F. H. Roberts, secretary and manager; M. Morgan, A. F. Call, Miss Catharine Fraser.

Legal Queries

Edw. L. Payne, attorney 301-304 Douglas Building Los Angeles will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

The following answers show that Mr. Payne will give valuable information to inquirers.

Filing on Water.

What are, briefly, the actions, legal and otherwise, necessary to appropriate running water for irrigation or other similar purposes? Can I enter my neighbor's field or he mine and appropriate such water if not already used below?—Subscriber

The inquirer is referred to sections 1415 to 1421 inclusive, of the Civil Code of the State of California.

Section 1415 prescribes the method of acquiring a right to the use of water, and is as follows:

"A person desiring to appropriate water must post a notice, in writing, in a conspicuous place at the point of intended diversion, stating therein:

1. That he claims water there flowing to the extent of (giving the number) inches, measured under a four-inch pressure;

2. The purpose for which he claims it, and the place of intended use;

3. The means by which he intends to divert it, and the size of the flume, ditch, pipe, or aqueduct in which he intends to divert it.

(Notice must be recorded) A copy of the notice must, within ten days after it is posted, be recorded in the office of the recorder of the county in which it is posted.

After filing such copy for record, the place of intended diversion or the place of intended use or the means by which it is intended to divert the water, may be changed by the person posting said notice or his assigns, if others are not injured by such change. This provision applies to notices already filed as well as to notices hereafter filed."

You cannot lawfully enter your neighbor's field nor can he enter yours and appropriate water, except, of course, by consent.

It has been held by the Supreme Court of the State of California and by the Supreme Court of the United States that the law authorizing the appropriation of water does not confer the right to enter upon lands in the possession of another for the purpose of securing the water thereon or completing an attempted diversion of water, even though the person seeking so to enter had, at some previous time, manifested an intention to secure a water right thereon.

The method of acquiring a right to the use of water, as prescribed by the above mentioned sections of the Code, is not exclusive. One may, by a prior actual and completed appropriation and without proceeding under the Code, acquire a right to the water beneficially used, which will be superior and paramount to the title of one making a subsequent appropriation from the same stream in the manner provided by the statute.—Edward L. Payne.

Personal Property and Leased Land.

"If a renter has a lease on a ranch for several years and he put on temporary buildings for his own use, such as sheds and bunk houses, has he a right to take them away at the expiration of his lease, there being nothing stated in the lease?"—Subscriber, Fresno.

The general rule is, that if the structure is permanently fastened to the soil, or permanently resting upon it, as in the case of buildings, it is a fixture and belongs to the realty; but this rule is so limited in its range and so productive of contradiction that it will not apply with much force, each case being determined upon the particular circumstances of the case. If in connection with the actual annexation to the realty the building is also appropriated to the use or purpose of that part of the realty with which it is connected, and it is the intention of the party making the annexation to make the article a permanent accession to the land (this intention being inferred from the nature of the article affixed, relation and situation of the party making the annexation, the structure and mode of annexation and the purpose and use for which annexation has been made), the building is then a fixture and cannot be removed except with the consent of the owner of the land.

Trees over Line.

Neighbor's walnut trees hang over the partition fence several feet. Has he a right to gather the nuts that fall on my side; if he does so after being forbidden, what course can I take?—Subscriber

If the trunk of the tree is wholly within the boundaries of one man's land, the entire tree belongs to him, even though the branches and roots may find their way into the land of the adjoining owner. The adjoining owner need not endure this trespass, but may cut off such projecting roots and branches. If the tree stands upon the boundary line so that a part of the tree is on either side, the tree is then the joint property of both, and neither can remove or injure it without the consent of the other.

You might refuse the owner of the trees access to your property, and thus prevent him gathering the nuts that fall on your side, and if he persists in trespassing upon your land, you could sue him for such trespass, but your damages would be probably nominal. If he forced his way upon your land in spite of you using reasonable force to keep him off, you could have him arrested for a breach of the peace.

On the other hand, if you gather and use the nuts which fall on your land, he might sue you for conversion. As to how such a lawsuit would be determined, I am not prepared to say, as judges and courts do not always agree with the opinions of attorneys. —Edward L. Payne.

GRAPE CULTURE IN CALIFORNIA.

The California Agricultural Experiment Station has sent out two booklets of value to viticulturists; one, bulletin 197, "Grape Culture in California" treats somewhat at length on the resistant roots and their value, also on diseases of the vine. The other, bulletin 198, the "Grape Leaf Hopper," gives method of procedure to rid vineyards of this pest. Either or both books may be had by applying to the Agricultural Experiment Station at Berkeley.

NURSERY INSPECTION.

The Maryland Experiment Station has issued a valuable report on nurseries and nursery inspection. It gives the method of procedure in that state but the most valuable feature of the book is a chapter on the various state laws. Each state in the Union has requirements which are published in this book so that nurserymen may know method of procedure and the inspectors to secure information from in each state.

Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

MACHINERY.

WE CARRY A GENERAL LINE OF MAchinery, gas engines, air compressors, boilers, engines and pumps. 40 car loads of screw pipe and casing can be cut to lengths, also all kinds and sizes of fittings. Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Household Department

A COUNTRY PUPPY.

His coat is rough and shaggy,
But his tail is very waggy,
For he wasn't educated with a whip.
He never knew a tether
Or a muzzle made of leather;
He's a free and independent little rip.

He thinks it mighty funny
To pursue a frightened bunny
Or to chase an angry squirrel up a trunk.
Though he's hardly finished growing,
He has reached the point of knowing
There's a difference 'twixt a woodchuck and a skunk.

He will cock a saucy ear up
At a whistle or a chirrup;
You should hear the merry music of his bark
When he comes to me careering
Through the meadow or the clearing
Like the infantile tornado on a lark.

Such a friendly little fellow!
Though he's pretty nearly yellow,
But he's coming for a confidential talk,
And his pleading eyes are saying
That today was meant for playing,
So I'd rather guess we're going for a walk.

—New York Times.

BEFORE THE WAR.

THE following account from a personal experience given in an interview in the Jacksonville, Florida, Times-Union is exciting and of considerable interest even after these years have passed.

Actively engaged in the thick of the African slave trade in the year 1857-58, shipping as carpenter on the brigantine Jeehossy, which at that time was among the private vessels owned and operated for the real purpose of carrying saleable blacks from states where they were quietly sold, and brought face to face with conditions as interesting as they were full of sensational detail, is the unique record of F. Klein, one of Pensacola's oldest and most esteemed citizens, who, after having finally settled in this city, has resided for forty-three years in the land of his adoption.

Shipped in 1857.

"After having learned the trade of ship carpenter," began Mr. Klein, "and having served my time in the Prussian navy, I went to Cardiff, England, and shipped on an American ship for Charleston, S. C. I had not been in the city long when I was offered good wages as carpenter on the brigantine Jeehossy, Capt. Vincent, bound for the Southwest coast of Africa. I accepted.

Receives First Order.

"The voyage continued, and we had just hove in sight of land, when I received orders to cut 'tween deck' beams from lumber we had carried aboard for that purpose. I was told to number them, in order that they might be placed in position at an hour's notice, as we went from one native settlement to another.

"It was the captain's plan to pursue the usual course of slave traders, which was to visit towns along the coast, and to confer with the French and Spanish dealers who kept the blacks for sale.

"These negroes, who had been in turn purchased from some tribe who had recently been at war, and who followed the usual custom of selling their prisoners to traders were kept in long stockades along the coast. They were given almost anything to eat, watered like animals, and kept there for the inspection of foreign buyers who would in turn take them on to the United States to be sold into slavery.

"The captain, however, was to experience a slight change in his plans.

Wild Blacks Take Possession.

"At the very first post we dropped anchor we were to get more than we had bargained for.

"As soon as the Jeehossy had been sighted from the land, three large canoes, each manned by fifty or more wild blacks, were seen rapidly approaching us.

"They were nude, excepting for the belt arrangements they wore, in which were thrust knives and other implements of warfare. Fnally they came up alongside, making many peculiar gesticulations. The captain gave them some rum, and they straightway began clamoring over the rail. Orders were quickly given not to allow any more aboard, but they grew fierce and threatening when an attempt was made to prevent them from coming.

"It began to look as if the crew was to be overwhelmed.

"Previous to this, I had sharpened some old cutlasses, which, with some old revolvers, were quickly distributed among our men.

"The cook was ordered to heat as much water as possible, and to scatter broken bottles on deck, preparatory to a hand to hand encounter with the visitors.

"The boiling water was to be thrown on the bare bodies of the negroes should they become more threatening, and during the general fistic encounter and scrambling about which was bound to ensue, according to our calculations, the burly black fellows, who, of course, wore no shoes, would be badly cut by the glass, a process which would retard their progress in any onslaught which they might plan.

"When the danger appeared at its thickest, and the crowd of blacks were becoming more and more unruly, a breeze suddenly sprang up from the land, and the captain saw his chance.

"Quickly setting sail, he caused the three canoes belonging to the negroes to be cut adrift and then put on full speed. The Jeehossy was fairly flying out to sea, and far in the distance we could just discern the three empty canoes of the savages as they bobbed helplessly up and down in the water.

"We had gone perhaps a mile and a half before the natives still on the ship finally saw what had happened, and that in allowing themselves to be thus duped they had lost their boats.

"The sight of home rapidly slipping from view didn't appear to look good to them, and one by one the fierce appearing humans dove into the water like rats, swiming their way to shore.

"This was probably the most exciting day of the entire voyage.

Bargain for Slaves.

"That the good (or bad) ship Jeehossy did finally come into direct communication with real slave traders is further proved by the remainder of the interesting narrative:

"The next day," continued Mr. Klein, "we came to a little town called Acra. It was here that the captain and supercargo went ashore and completed a bargain for a num-

ber of slaves which were to be taken aboard.

"I never knew how much the average trader charged for his slaves, neither could I find out. That generally remained a secret with the captain.

"After the deal was closed, the sea being rough, we decided to await calm before taking the negroes aboard.

"That was to be a disastrous wait for all hands. The next day, to our surprise, an American war vessel came within speaking distance. She exchanged civilities with us, leaving almost immediately.

"Close on her trail came another war vessel. We had begun to be somewhat suspicious. When she proved to be an English man-o'-war, we knew that our fears had not been unfounded. Her officers had probably decided to ascertain the nature of the business in which we were engaged.

"Finally a boat was lowered and an officer came aboard. He shook hands with the captain and supercargo, and without any investigation whatever, returned to his ship.

"A second officer suddenly made it his business to pay us a visit, and succeeded in overhauling and disclosing everything. There were the iron bars with handcuffs attached, iron grating for the hatches, sacks of red bread and rice with which we had intended to feed the negroes, and also the between deck beams, which I had lately made and numbered.

"The captain made numerous excuses, but to no avail. We were taken aboard the man-o'-war, whose name was learned to be The Falcon and kept under strict surveillance for ten days. There was not a man among us, however, who failed to 'keep mum,' and we were finally returned to our own vessel.

"'You have taken us for thieves,' said our captain to the Englishman, 'and we will just wait around in the waters until an American man-o'-war comes by and squares accounts for us.'

"In reality, however, we hoped to outstay the Britishers, who still entertained serious suspicions regarding our movements, and then take on our cargo of slaves. After two months' waiting, however, we were forced to give up, and put for home without so much as a single black aboard.

Received no Money.

Thus it was even before the great civil war cloud had broken, when the slave trade had begun eating its way into the law and rule of a great and glorious country like the rancid growing cancer that it was that the brigantine Jeehossy finally returned to the port of Charleston one day in the spring of 1858, after a very unfortunate financial venture.

She had been besieged at every turn by continued ill fortune. Her crew received the monthly wage, but the extra money which was to have been given in case the trip had been successful, was of course withheld.

TRYING HIM OUT.

"Did you know, Willie, that your big sister had invited me to take dinner with your family next Sunday?" asked Mr. Newbeau.

"Sure!" replied her little brother. "Ma and pa told her they wanted to see what kind of table manners you've got."—Philadelphia Press.

A recent rabbit drive at Lancaster was declared to be a success, many thousand rabbits being killed.

"The habit of wishing everybody well, of feeling like giving everybody a Godspeed, ennobles and beautifies the character wonderfully, magnifies our ability, and multiplies our mental power."—Orison Sweet Marden.

RECEIPES.

Sour kraut can be put into stone jars, kegs or barrels. Take nice solid heads of cabbage and cut them on a slaw cutter. Make a layer of about two inches deep in the bottom of the jar, sprinkle lightly with salt and press as firmly as possible with the palm of the hand, add more cabbage, sprinkle salt and press as before and continue until the jar is filled to within two or three inches of the top with cabbage firmly pressed down. When the juice is overflowing cover with a cloth, take a clean board, cut round to just fit inside the jar and place a heavy weight on top. Have a cover that will fit loosely over it. In a day or two the cabbage will begin to ferment. When the juice begins to go down add salt to the water, a teaspoonful to a pint, and fill up the jar. Do not allow the juice to fall below the board. In about two or three weeks the kraut will be made. Take out the cloth, board and weight every week and scald them.

Holland Soup.

Use two pork hocks or four pounds shoulder, one quart dried green peas, one large onion, one large potato, half celery root or one stalk English celery, a little parsley; soak the peas overnight. Put on to boil in the same water with the meat for about two hours; then add the other vegetables, except the parsley; salt and pepper according to taste, and before serving the chopped parsley is added as a garnish.

Invalids' Dishes.

If in making broth from fowl you will remove the skin you will find that the flavor of the broth will be more delicate and delicious than if the skin is left on the fowl.

Egg-nog is advised for invalids by most doctors because of its nourishing properties, although many sick people become tired of it after a while. If changes are made in the flavor of the egg-nog they will relish it more. For instance, the egg-nog is delicious if only the stiff beaten white is used instead of the entire egg. Changes can be made in the taste if sherry, brandy, vanilla and nutmeg are used as flavors.

HOMELY HINTS.

When a splinter has been driven deep into the hand, it can be extracted without pain by steam. Nearly fill a wide-mouthed bottle with hot water, place the injured part over the mouth of the bottle, and press tightly. The suction will draw the flesh down, and in a minute or two the steam will extricate the splinter and the inflammation will disappear.—November Woman's Home Companion.

Rub cocoa butter, mutton tallow or vaseline on the nails every night if you are troubled with hang nails and gently press the adherent skin away from the roots of the nails and after washing the hands keep the skin loosened from the nail with an orange-wood stick. With this treatment these homely and painful little nuisances will soon be removed and if one is careful they can safely be kept at a distance. If the nails are brittle rub olive oil into them every night.

Children in playing around often get their garments stained with grass, and unless this stain is removed by the proper method it is likely to remain indefinitely. If ammonia and water are applied to the stain at once it will be removed easily, but where the stain has dried soap and warm water should be used. If the garment is such that the color may be affected, molasses should be used. Spread the molasses on the stain and allow it to remain for several hours, after which the garment should be washed.

Heat

Where you want it—
When you want it—
No smoke—no smell—no trouble.

Often you want heat in a hurry in some room in the house the furnace does not reach. It's so easy to pick up and carry a

PERFECTION Oil Heater

(Equipped with Smokeless Device)

to the room you want to heat—suitable for any room in the house. It has a real smokeless device absolutely preventing smoke or smell—turn the wick as high as you can or as low as you like—brass font holds 4 quarts of oil that gives out glowing heat for 9 hours. Finished in japan and nickel—an ornament anywhere. Every heater warranted.

The **Rayo** Lamp

is the lamp for the student or reader. It gives a brilliant, steady light that makes study a pleasure. Made of brass, nickel plated and equipped with the latest improved central draft burner. Every lamp warranted.

If you cannot obtain the Perfection Oil Heater or Rayo Lamp from your dealer write to our nearest agency for descriptive circular.

Hay.

Somers & Co., say:

Receipts of hay on the San Francisco market have amounted to 2250 tons during the past week, which is the smallest amount we have received during the present season. As a natural result, prices are higher, especially as trade continues to be about the same here in town and more active throughout the country districts. The difficulty in securing cars for shipments of hay continues and were it not for the fact that considerable hay is stored at water points, thereby being available for the market at any time, we undoubtedly would experience quite a severe hay famine in San Francisco.

Most of the hay which has been arriving is of the better class and although this is higher, yet the most noticeable advance is with the poorer grades which are considerably used, especially in times of high prices.

Alfalfa has been arriving very freely, mostly by water for the season for marketing the river alfalfa is about closed and all holders are anxious to market their hay before it is damaged by rain. In spite of the fact that alfalfa receipts have been heavy the market for this article is firm, the consumption being increased not only for dairy purposes, owing to the high price of feed stuffs, but also for horse feed as there is such a difference in the value of alfalfa and grain hay.

Citrus Market

LOS ANGELES, Nov. 4, 1908.

The citrus year closed last Saturday night. The total shipments for the year were 24,540 cars of oranges and 4958 of lemons, from Southern California or a total of 29,498 cars.

From Tulare and Butte counties an additional 2931 cars of citrus fruits were shipped which makes a grand total of 32,429 cars of golden fruit. This is crowding up close to one hundred cars, or four or five train loads of fruit for every day in the year.

It is a wonderful business and will grow and extend to other sections in the state.

Valencias closed the year with the biggest prices of the season.

Shipments for the new year are starting and during the coming week many will go from Tulare and Butte counties. Southern California is doing but little as yet.

NEW YORK, Oct. 30.—Two cars Valencias and two cars lemons sold. The market is very strong on Valencias; active but slightly lower on lemons. Weather cool, clear.

PITTSBURG, Oct. 30.—Two cars sold, nothing on track. The market is firm on good fruit. Weather cool.

NEW IN IRRIGATION.

Continued from Page 437.

day. Soil that is wet on the surface in the morning will show no indication of moisture at midday. Evaporation is arrested by the atmosphere cooling at night and as capillary action continues increasing as long as the moisture holds out, part of it collects on the surface and part of it evaporates even though it is night. During the daytime the evaporation is more rapid than the rise of the moisture by capillary action, consequently there is no moisture visible and no attention is given the matter where the question has not been given serious consideration. It is a fact however, that during a certain period after irrigation, this condition can be plainly seen.

Therefore, it behooves the man who has to pay out money to wet his land, to attend to this detail and get on the land with a cultivator as soon as possible after irrigation.

Sonoma County Pomona Grange officers were recently installed by the Master of the State Grange and the proceedings were followed by a banquet. The officers are: Master, J. M. Talbot; Overseer, W. Church; Lecturer, C. E. Wingate; Steward, H. N. N. Latimer; Assistant Steward, Percy Hansen; Chaplain, Mrs. H. Gregory; Treasurer, N. A. Griffith; Secretary, Minnie Church; Gatekeeper, George Meissner; L. A. Steward, M. V. Griffith; Pianist, M. E. Winans.

The Tulare County Citrus Fair will be held at Exeter, December 1-5.

THE TRAVELING INSTITUTE.

The Southern Pacific Company under the direction of its traffic department has decided to operate free agricultural and horticultural instruction trains throughout the state with the co-operation of the University of Californit, Stanford University, the Department of Agriculture and the State Horticultural Commission.

The University of California through its extension work has accomplished a great deal and the Government through its Bureaus of Soils and Plant Industry and the Horticultural Commission through its campaign in behalf of better quarantine laws and its fight against tree pests, have done a great deal for California in making cultivation more effective.

The Southern Pacific Company in co-operation with the institutions named has therefore decided to create a special train carrying lecture car and living cars so that stops if desired, can be made at the most important stations and so also that meetings of one or two hours duration may be held at several different points during the day, economizing greatly in time. The meetings will of course be held in halls where available and otherwise in the lecture car. It is expected that the discussions will be practical and adapted to the needs of the immediate locality under consideration. People in that section having hard problems to solve will no doubt come loaded with questions. It is believed that a great deal of good can be accomplished in this way with the minimum of effort.

Boards of Trade, Improvement Clubs and similar local organizations are invited to give their recommendations as to the itineraries of the trains through the local District Freight and Passenger agents of the Southern Pacific or to the University people.

A BIG ORDER.

The National Wood Pipe Co., continues to receive big orders for its effective and economical pipe. This pipe has been proved by years of use to be durable and satisfactory in every way.

The company has just been awarded a contract for over 40,000 feet of our 4-6-8 and 10 Machine Banded Wood Pipe for installation in the Teague, Texas, municipal water system, John W. Maxcy, Houston, Texas, Consulting Engineer. The city of Teague will install a complete municipal water works system.

Big orders are almost a daily occurence of this company.

Growing the Eucalyptus Tree for Profit

General Directions as to Planting, Care, and Purposes of Eucalypts

Written for the Cultivator by LEONARD COATES of Morganhill

IN reading the mass of literature published on this subject, the average layman is very apt to become confused, and to wonder more than ever what are the first steps to take, and which plan he should follow out of the many suggested by the host of writers. The object here is to give the necessary information that is needed by those who are investigating eucalyptus culture because of the fact, duly appreciated, of the alarming shortage of hardwood supply in the markets of the United States, and the ability of California to supply this deficiency by the cultivation of certain species belonging to this great family of hardwood trees.

The Seed.

The seed of most species of eucalyptus is very small, almost powder-like, and sells from $4.00 to $20.00 a pound, according to scarcity or difficulty in collecting. It is of no use to describe the methods employed in sowing the seed and raising the seedlings. This is purely the work of the professional propagator. For any other than an expert gardener to attempt to raise the plants successfully, is to court failure, and to purchase the seed is a mere waste of money. Wealthy syndicates, or those who contemplate planting eucalyptus trees by the hundred thousand, can afford to hire gardeners to do this work; those who try it themselves often find the experiment rather costly. Suffice it to say, that the seed is sown from early spring until the autumn, according to climatic conditions, and depending, also, upon the natural vigor of the species, some growing much more rapidly than others.

The Seedling.

The little plants are transplanted from the seed boxes as soon as they can be handled, and so planted, in a good, rather stiff soil, that there will be in each box, or "flat," one hundred, ten in a row. These are ready for permanent planting any time from February to April.

Another method, but not so generally followed, is to transplant from the seed box to small pots, 1¾ or 2-inch diameter. Where the soil is sandy, and weather usually warm and dry at planting time, this is the surer way to handle the plants, but they would cost more.

Soil and Location.

The eucalyptus family is a very extensive one, and therefore some members of it are found that succeed in almost any kind of soil. But it is a great mistake to think that any eucalyptus tree will grow anywhere, or that a soil or location that is good for nothing else will do for "gum" trees. To get good results care must be taken to select those sorts which are known to flourish under certain conditions. For instance:

E. robusta, or swamp mahogany, thrives best in very wet soil, even when undrained and "sour," which would be fatal to almost any other.

E. corynocalyx, or sugar gum, on the other hand, must be planted in well-drained or dry soils, or on hillsides.

E. diversicolor and E. pilularis, and others, thrive best near the coast, not liking the great heat of the interior valleys, while E. rudis and E. polyanthema, while they grow well anywhere, are not injured at all by the hottest weather, and luxuriate under the hot sunshine of the San Joaquin valley.

Preparing the Land.

Heavy land, and especially if inclined to adobe, should be plowed early, left fallow, and, towards spring, or whenever dry enough, worked down with the disc and the harrow. It is even safer to plow such land in the fall, while dry. Lighter soils may be plowed any time during the winter, but it is always necessary to have the surface well pulverized, which much facilitates the work at planting time. Steep hillsides should be left unplowed until the heavy rains are over, or the soil may "wash."

Planting.

The plants will be from 8 to 18 inches high, depending upon the variety, and the method of growing the seedlings. They are generally transplanted into "flats," holding 100 plants, and are cut out with a strong knife so that each plant has attached to its roots a solid block of earth. The most precise and accurate method of planting is to get the square and stake off the rows at two ends of a block, and plant with a twisted wire or clothesline, a piece of rag being fastened at every six feet, following the same plan as in vineyard planting. Or, the land may be marked off with a corn-marker, the plants being set at the intersection of the cross lines. In this case, particularly if the locality be a dry one, with small annual rainfall, it is well to plow a furrow along one of the lines, and plant at the bottom, gradually filling up the furrow with spring cultivating. In this way, the plants become very deeply set in the ground, without the disadvantage of planting too deep at first, while the land is cold and wet, which would retard growth. On steep hillsides, the only way is to mark with the plow, following the contour of the hill. If the plants are grown in pots, the pot is held upside down and tapped lightly on a box, the whole plant slipping out without disturbing the roots. One writer alluded to this as a "vile method," saying that trees so raised would blow over after they had attained size. Such a remark is entirely without reason. The roots are cramped and bunched in either case, and in the pot less disturbed than when cut out of the flat. But they grow well whichever plan is adopted, each making tap or horizontal roots, according to its nature, as soon as it has the soil for them to run in. The pot method is more expensive, but I would give it the preference, otherwise. A garden trowel is the most convenient tool to use in planting, and the earth should be firmly pressed about the roots, loose earth being left at the surface. Plant several inches deeper than the seedlings stand in the flat or pot.

Cultivating.

It is a false economy to stint the cultivation of eucalyptus trees the first year. The young trees, as the roots continue to penetrate into moist earth, will grow very strongly until checked by cold weather, and the hardier kinds will grow all winter. Keep the land loose and free of weeds by frequent deep cultivating. The second year one plowing, and sufficient cultivating to keep down the weeds, will be sufficient. After that, little or no cultivation is needed as the trees will have grown enough to shade the ground, and prevent much weed growth.

Irrigating.

This is not necessary unless the conditions are essentially "arid." Deep rooting is to be encouraged by no surface irrigation after the plants are set, unless absolutely necessary. It is always better to thoroughly soak the ground in the winter, before planting.

Trimming.

During the first season's growth some of the young trees will show an inclination to fork, and others to throw out a strong lateral branch. These should be cut off, close to the main stem. The ordinary laterals need not be cut; they will die and fall off subsequently, and without attaining sufficient size to leave knots in the bole.

Replanting.

If there are only a few occasional vacancies, it is not worth while to replace, and if, for any cause, there should be a large number of missing trees, they could be re-set the same season, for planting may be done in the summer, water being used at the time.

It is often a good plan to arrange with the nurseryman to transplant the second time 5 per cent. or 10 per cent. of the total number into boxes containing 50 plants, which would be very strong by the next season, should it be desired to fill up all vacancies. A stand of 95 per cent. should be had with any ordinarily careful planting, however.

Species.

There are about fifty species of eucalyptus growing at the State University Substation at Santa Monica. On our plantations at Morganhill in Santa Clara county we have thirty species growing, which are being to from time to time. We have planted in forest form 6x6 feet, in level valley land, on dry hillside, and in black adobe.

For cenvenient refernce, I will name certain species which may be relied upon to thrive under specified conditions, particularly in regard to location.

For Sacramento and San Joaquin Valley.

E. rostrata, E. tereticornis, E. viminalis, E. rudis, E. polyanthema, E. crebra, E. leucoxylon, E. corynocalyx, E. siderophloia. Of these, E. corynocalyx is sometimes injured by frost while young, like E. globulus or the blue gum.

E. rostrata will stand a good deal of alkali,

E. rostrata, E. tereticornis, E. rudis thrive in plenty of moisture, even in boggy land.

E. corynocalyx needs a dry or well-drained soil. The others do not like extremes of wet or dry soil.

Uses.

For wind breaks—E. viminalis and E. rudis.

For shade—E. corynocalyx, E. polyanthema, E. rudis.

For fuel—E. corynocalyx, E. polyanthema, E. rostrata, E. viminalis, E. tereticornis.

For posts, railroad ties and other underground work—E. corynocalyx, E. crebra, E. polyanthema, E. rostrata, E. rudis, E. siderophloia, E. tereticornis.

For wagon work, shipbuilding, etc.—E. rostrata, E. tereticornis, E. siderophloia. E. corynocalyx.

For Coast or Bay Counties.

E. globulus, E. rostrata, E. tereticornis, E. viminolis, E. rudis, E. corynocalyx, E. crebra, E. robusta, E. amygdalina, E. diversicolor, E. pilularis, E. polyanthema, E. cornuta, E. saligna, E. coccifera, E. siderophloca, E. urnigera, E. sideroxylon, E. Muellerii, E. leucoxylon, E. Gunnii, E. Stuartiana, E. regnans, E. obliqua, E. Siberiana.

E. robusta grows in swamps.

E. urnigera, E. Muellerii, E. coccifera, E.

Continued on page 473.

Save Time--Save Fruit
With the Brewster Picking Sack

A new method sack—invented and perfected by lifelong growers. Eminent orchardists pronounce it perfect. Those who have tried it say they would not be without it. Actual tests show that a man can pick twenty-five per cent more fruit with it and with greater ease.

Sack forms semi-circle about picker's body—is supported by straps over both shoulders and held tight by belt around body. The picker can thus work with ease either on ground or ladder. When full, it does not extend below the hips.

A great feature of the Brewster Sack is the patent gate (see illustration), WHICH PRACTICALLY ELIMINATES BRUISING. Simply unfasten a hook—the gate drops—and the fruit can be quickly but very gently poured out.

The sack holds as much fruit as the old style sack.

Made of double filled canvas, over strong steel frames; strong sustaining straps; practically indestructible.

Sent express prepaid to any address for $1.50.

Sierra Madre Sack Company - Sierra Madre, Cal.

We want reliable men in every locality to demonstrate this sack and act as our agents.

PARASITES.

The following was written especially for the Cultivator by Prof. A. J. Cook of Pomona College. Prof. Cook was at one time a regular contributor for the Cultivator and his old friends will be glad to see him back.—Ed.

THE word parasites, as used by entomologists, has a more restricted meaning than that usually understood, when this term is used. Indeed, the word is used in several senses. The pork tape worm and related forms are known as parasites, and they work in the tissues of other animals, often working fearful destruction, and not infrequently man himself is the victim. The various lice, which work on nearly all birds and mammals, and which are so very annoying, are generally called parasites. These belong to two different orders of insects, the common lice, which have beaks and suck as do all bugs, and the bird lice, which are possessed with jaws, and bite. Both groups are very serious pests, as is too well known. Again many use the term parasite for any insects that destroy other insects. Thus the lady-bird beetles that eat up their victims, usually plant lice or aphids, as does the cat the mouse, are often called by this name. It were better if we would always call these predaceous insects and reserve the word parasite for such as we are about to describe in this article.

The True Insect Parasites.

When the entomologist uses the word parasite, he refers to those insects that lay their eggs either in or on or near the insect which is to be victimized, and when the egg hatches, the minute larva bores into its host, if not there already, and proceeds to appropriate its blood for its own nourishment. The parasite grows and thrives, while its victim grows feeble and soon is no more. The more important of these parasites belong to the Hymenoptera, or the same order as does the honey bee. One very important family, the Tachina flies, are Dipterous, or two-winged flies, and so are closely related to the common house fly, which they much resemble.

The Hymenopterous Parasites.

There are four families of these very important parasitic Hymenoptera, many of which are very minute, so that they are not at all known except to the student of insects. Perhaps the most important of these are the Chalcid flies—Chalcididae. These are compact, wasp-like insects, often brilliantly colored, with very simple wings, and usually so very minute that they can only be studied with a good microscope. These little friends often lay scores of eggs in a single caterpillar, or other unfortunate, and so the victim may be truly said to be eaten up alive. Except for bees that do such immense good in pollinating flowers, there is probably no family of insects that do as much for us as do these little Chalcid flies. It has been said that we should be unable to make any success in agriculture were it not for these little friends.

Two other families, the Ichneumonidae and the Braconidae, are much alike, except in wing venation, which is much more complex than is that of the Chalicids; are also much like wasps, though the bodies are usually not so compact, and these are often large, and possessed of long ovipositors. They insert these in caterpillars and other insects as they lay their eggs and often use them to bore into hardwood trees like the beech and maple, and strangely enough they know that the grub or other borer is there to receive the fatal eggs. Another family, the Proctotrypidae, is even more interesting as these insects are so very minute that they can get enough food from a minute egg, and so they are called egg-parasites. When we remember that the insect egg is very minute, we wonder that a form can be so minute that it can get its life's nourishment from a single egg, and yet this little friend has all the organs that its larger brother possesses. To my thinking God's wisdom is nowhere more exemplified, than in these minute creatures of His handiwork. How so minute a form can be so complex, and yet work with absolute perfection, passes comprehension.

Great Value of Parasites.

As I said above, if we except bees in the great role of pollination, there are no insects that compare with these parasites in the value wrought for man. There are a score and more of scale insects that work on our citrus fruits of California. All of these would be most serious pests, except for these parasites. As it is there are four only that are a menace to our fruit grower's interests. All the others are held in check by parasites, or other insect enemies. When I say that thousands of dollars are expended annually to protect against these four, we can well imagine what would be to pay were it not for these little abettors, that are always working for us without pay.

Importing Other Parasites.

There is another bright picture regarding these little friends. We find that often we can import parasites which infest our insect foes, in their native haunts, and which for some reason were not imported when we brought the pests to our shores. Massachusetts spent well nigh a million dollars trying to exterminate those two alarming pests, the brown tail-moth and the Gipsy moth, and was forced to give it up as one of the impossibilities. She now is importing the parasites from Europe, and bids fair to succeed in staying the evil at small cost. In our own region, we are alarmed by an invasion of some of our orchards by the mealy bug. This is worse than the scale insects, even, as it is almost impossible to kill it by use of our best insecticides. We are finding that by importing a little lady beetle, a predaceous species, we are likely to banish the hateful mealy bug at a very slight expense.

It is surely a great satisfaction to the beekeeper that this good work is going on and that his honey bees are close relatives of these parasitic hosts.

ORANGE GROWING AT COACHELLA.

Heretofore the efforts of the farmers of the Coachella valley have been devoted mainly to the growing of crops that would give quick returns—crops that could be planted, grown and harvested in a season. Near Mecca, however, Peters & Evans of Riverside have planted 70 acres of oranges that are growing vigorously and promise a bearing orchard within

a much shorter time than is required to bring trees to a bearing age and size in the older orange growing districts. The navel orange trees on the Peters & Evans ranch have produced fruit of deep, rich color, smooth, thin skin and of fine texture and flavor. These navels are ripe and sweet the first of November. At Coachella there are a few seedling orange trees that have been growing there for several years, uncultivated and uncared for. The oranges produced on these trees are, however, as well matured and ripened the first of December as seedling oranges are in Redlands and Highland the latter part of March. Neither these trees nor their fruit have ever shown the slightest injury from frost. Orange experts who have closely observed the climate and soil conditions of the Coachella valley during the last five years are fully convinced that all of the good land around Coachella is perfectly adapted to successful orange growing. It is confidently predicted by them that within a very few years there will be a very large acreage of thrifty, profitable orange groves tributary to Coachella. A company of Redlands orange growers are preparing to plant a ten-acre tract adjoining Coachella to orange nursery stock and will soon be prepared to supply trees for planting in orchards.

To those who have noted the high prices realized for the ripe sweet navels shipped to the eastern markets from Arizona early in the season, there can be no doubt as to the great profits to be realized from orange growing at Coachella. There is an unlimited demand for sweet, ripe navels for the early markets and these can be produced in perfection in this valley.—Redlands Review.

A farmer near Stockton has established a record for late sown barley. He has just finished harvesting 21,000 pounds grown on ten acres. The seed was not sown until the 23rd day of June. It was grown on land flooded by storm water and thorough preparation and the rich soil did the rest.

Property owners of Fresno county are contemplating a vast drainage project by which 200,000 acres of Fresno county will be drained and made tillable.

A REAL NOVELTY.

A new roof covering which has recently been patented promises a satisfactory solution to the rather serious question of what to use in place of shingles. Shingles, as all prospective builders have found out, are not only scarce and costly, but seem to grow less satisfactory every year, owing to the tendency to use stumps and waste instead of the prime lumber formerly used.

This new material, which is called ZOLIUM, is composed of long tough fibres, solidly matted together with heavy cohesive gums into long sheets. Both sides are then tempered or hardened into an impenetrable skin which the atmosphere will not injure.

The most interesting feature of ZOLIUM is that it has all the appearance on the roof of individual, diamend shaped tiles, each overlapping the one beneath. This effect is secured by laying one saw tooth edged sheet over another, the points of the upper sheet just touching the upper angles of the lower. The color is a warm Indian red, adjoining tiles varying slightly in tone.

Full information regarding this important invention can be obtained of J. A. & W. Bird & Co., Boston, Mass., who are the patentees and makers.

The Telephones That Work

When a man telephones from New York to Chicago, 900 miles, he pays $5.00 for a three-minute conversation. For that sort of service only the very best apparatus and equipment will do—*telephones that work.* It is, therefore, a pretty strong argument for Western Electric Quality when you learn that every telephone message from New York to Chicago, goes over

Western Electric Apparatus and Equipment

Whether you want to telephone 900 feet or 900 miles, if you have a telephone at all, *you want a telephone that will work.* A reliable telephone is of inestimable value—a poor telephone is worse than none.

We make a specialty of rural telephone equipment, furnishing specially designed apparatus of the same high quality standard as that used by the largest operating companies of the world.

Do Irrigation Work---Quicker and Easier

For Leveling Fields—For Cutting and Clearing Laterals

The photo is from an actual field-scene in New Mexico, where a 20th Century Grader is leveling seed-beds on the great truck-farm of Herman Blueher. He says: "Your 20th Century Grader has no equal for land-leveling, seed-bed making, ditching and for all kinds of irrigation work. I have reduced my force one-third since buying this machine." The

20th Century Grader

weighs only 600 lbs—light and handy—and is easily handled by one man and two horses. It is all steel and malleable iron. Price very reasonable. It pays for itself in one season. If your dealer hasn't it ask for name of nearest agent. Write now for new free booklet with large cuts showing every part.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths, Fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

Deciduous Fruit Culture

By J. W. Mills

PLANTING A VINEYARD.

By Mrs. Minna E. Sherman of Fresno, Before Farmers' Institute at Davis.

When the land is ready the time of planting comes, and the laying off of the rows of the vineyard. Find, first of all, the true north and east lines, measure the length of one planting chain and then measure off another at right angles to the first one. Place the next wire across the end of the first one and stake at the end of each wire; move the first wire to the other one and stake there; keep moving and staking at the end of each planting chain until the entire vineyard is plotted off. Now, sometimes, there are trifling irregularities that take up the length of the chain; by sighting across the rows of stakes these are discovered and corrected.

The best planting chains are made of several strands of wire twisted together; at each end a ring is fastened to slide on the crow-bars to hold it taut. At regular intervals a tin button is soldered at the distances apart the vines are planted. The hardware people make these chains but as they have no way of stretching them, we buy the wire, bring it home and stretch it by horse power. An end of the wire is secured around the snubbing post in the corral and the horse attached at the other end. It is given three steady pulls; this will bring it out to its fullest extension. Then we send it in and have the buttons soldered on.

The large vineyard is planted quicker if five or seven chains are used. The field bosses can move one forward, while the men are planting on the other. By having an extra chain in position one man on a truck can distribute the small stakes at the places where the vines are to stand. These whitewashed stakes are made by sawing the bundles of four foot lathes in three lengths. The young vines are almost impossible to see at any distance, and the stakes keep the teams from running over them. The truck, also, can carry well rotted manure to place under the vines if the soil is very light.

At one time we set the stakes before planting the vines but found it was not the best way. When the stake was already in place the men would slight the planting, so that they did not have to remove the stake. As we are not planting stakes, but vines, the vines should receive the careful handling and not the stakes.

Each man, as he plants the vines, throws the top earth in one spot and the under soil in another. A shovelful of manure goes into the hole, then a few inches of the top soil. The young vine is stood leaning against the button on the wire and the next shovel full of earth is put in and settled with the hands carefully. A little water from the can settles the earth under the roots. Then more top soil, and the man's foot firms it down, then a covering of two or three inches of loose soil on top of it all. All warm top soil is used and the bottom soil is left on the ground. The small whitewashed stake is placed at the right side of the vine and against the wire, so that vines and stakes are both in perfect line.

The proper distance for vines in a vineyard has never been settled. Four by eight, four by ten, four by twelve, are often found in trellised vines. Eight by ten, ten by fourteen and ten by twelve are common in the vineyards around Fresno. The avenues in the vineyards are sometimes every twelveth row, and sometimes as much as sixteen rows are between them.

The importance of having the rows straight cannot be too strongly insisted on. A young vineyard should be as regular as a troop of well drilled soldiers.

No matter how straight the young vineyard is planted, the old vineyard will have received so many bumps from careless plow boys that the vines will be wobbling and far from straight. In looking down the rows of an old vineyard one can imagine them bobbing along, as they sing "We are jolly good fellows." They have a look of enjoyment as they tip out of line in every direction, a rollicking expression that makes them seem very human.

Cuttings or Roots.

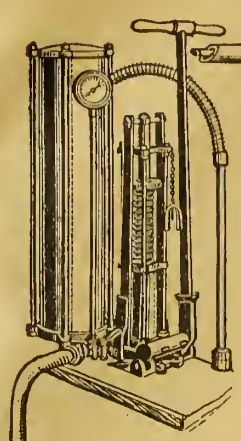
The best vineyards are grown from the cuttings made on the place and rooted in the home nursery. These young vines are taken up from the nursery only a few hours before they are planted. The roots and tops are pruned and they are tied up in bunches of a hundred. Only the best are used for planting. The others are healed in to be sold later in the season. The bunches of young vines are placed in cans of water and are hauled to the vineyard to be planted. As soon as the vines are in the ground a shallow furrow is run along one side and a small stream of irrigation water is turned and let soak down.

The earth is thrown back into the furrow as soon as possible and the entire surface is cultivated to loosen up the tramping of the men in planting.

Twenty-three years ago the first planting of vineyards began. Now, I think though the vineyards were all on two sections of land it may be called the planting of twenty-three vineyards. The twenty-fourth one will be planted next March. Now nineteen of these vineyards have been planted with rootings and four with cuttings. Only twice have we failed to secure a fair stand. Therefore, with proper care a good vineyard may be secured with cuttings. The question always arises, and often discussions follow the advice to plant rootings, rather than cuttings. The first cost of cuttings looks enticingly cheap, but to my mind it is foolish to consider first cost and not last cost.

The cutting vineyard requires to be watered twice as often and cultivated twice as often as the rootings. Should the year be a short one in water the vines suffer, for the last watering must come as late as the last week in August. The work of caring for them is spread over many acres instead of being concentrated into one or two acres at the most.

It seems wicked to waste work, it is taking the margins of time from life that can be used to better advantage. These little margins of time and what we do in them hold our destiny as men and women. If we waste them in foolishness we never accomplish much but the daily routine of work. Eat, sleep and die like the animals around us. The playwork, the hob-



More Money For You

Greater productiveness of trees—larger, cleaner, and finer fruit—more money. Isn't that fruit growers' reasoning? Nothing will contribute to this end more than effective spraying. And **Effective Spraying** can best be attained with

Bean Magic Spray Pumps

Effective spraying means **High Pressure Spraying** and till the advent of the Bean Magics a high pressure could not be maintained with a hand pump for any length of time, on account of the body-racking effort needed to operate it. The Bean patent spring divides the work between the two strokes of the handle and works against only one-half the pressure shown on the gauge and saves exactly one-third the labor.

Our illustrated catalog No. 21 describes ten sizes of hand pumps, and contains much valuable spray information, and formulas. Catalog No. 22 describes Power Sprayers. Both books sent free. Write for our special offer; state number of acres and kind of fruit.

bies that we ride in our spare time, make the test of what we are worth. Study yourself by finding out what you do with the time that has no pressing duties.

The rootings for the vineyards have sometimes fallen short and the space prepared has been filled out with cuttings. The cutting portion was a year younger. When the rooted portion gave a crop at four years old the cutting vineyard was three years old and did not have more than a trifling crop. After nineteen years I do not see that the first cutting vineyard has held out any better than the rootings.

The cuttings have the disadvantage of lack of selection when planted directly into vineyard form, while a rooting has two selections. What would a dairyman have if he bought every cow offered to him? Yet the cuttings are commonly made from brush that has laid on the ground for days and is then hauled in to the men that make cuttings. The men making cuttings should stand at the side of the pruners and make the butt cuttings only from vigorous, growing vines; tie the cuttings into bunches of a thousand; and all should be healed at night. Burying them a foot under ground with the butt ends up will help to callous them over healthily.

The piece of ground intended for the nursery has been worked over several times during the winter and is in mellow shape, when, during March the cuttings are placed in nursery rows. The plow runs a deep furrow leaving a straight bank on one side and the cuttings are stood along in the furrow six inches apart with only the top bud above the surface. The earth is thrown back by the plow to cover the cuttings. The man handling the cuttings throws away any that are not well calloused, as the wood of that cutting was probably not well ripened. Now, when these cuttings are rootings, they are again carefully selected and nothing that has failed to make a good growth is put into the vineyards. After the plow has covered the cuttings the earth is settled around them with water, and the cultivator is run over them frequently to hold a good dust mulch. The many acres of ground required to hold the cutting vineyard is raising a crop of winter grain and a summer crop of corn, while in the little nursery the cuttings are receiving the best of care. When the time comes to put them into the vineyard the tree digger is run under them and they are loosened and easily taken out of the ground.

Some people seem to think that in order to spray their orchards they must have a big two-horse outfit and pay out a lot of money to start. Nothing of the kind! An orchard of 100 trees can quickly be sprayed by a barrel sprayer set on a stone sled drawn by a single horse.

One reason why the retail price of fruit is so high is that at least one-third of the entire crop rots either in the hands of the wholesale or retail dealer. And this is due to bad packing or unsuitable conditions in the city storehouses.

The human eye is the great fruit-buyer and we must put our fruit up in neat attractive packages if we obtain the best prices on the markets.

Look in the "classified liners" for a chance to make $7.50.

FUTURE OF CELERY INDUSTRY.

From the address on the Future of the Celery Industry of Mr. H. S. Hazeltine before Winterburg Institute.

But some of you may be asking yourselves. "How can I grow a first class product which will meet the requirements of the trade?" If you will permit me the time I will take up a few of the most important subjects which interest the farmers of today. It will not be necessary to go into details relative to growing and packing celery, as I believe we are pretty well versed and united on the matter. I think more attention should be given to preparing the soil for a crop, and to irrigating. Black Heart is also an interesting subject to talk about; crop rotation should be studied more closely than it is; and in order to start a discussion I will give my views on the four subjects:

Properly Preparing Soil for Celery.

Beginning in the winter as soon as the land is available, level it to a grade, as it is necessary to irrigate frequently and this cannot be done successfully without an absolutely perfect grade, so that the water will run from one end of the field to the other without pooling up. This done, plow the soil shallow if it be of a clay nature, or a deep discing will do if the soil is peat or of a sandy sediment nature; then seed to some leguminous plant, the California burr clover preferred, owing to the enormous amount of humus it furnishes in addition to the nitrogen. It is a natural crop for our soil and climate, starts quickly and makes a vigorous growth during the cold weather. If the soil is of a clay nature and insufficiently drained, I would recommend sowing rape, as it sends out a tremendous mass of roots, penetrating the hardest clods, thereby rendering the soil mellow, porous and sun fertilized, ready to produce a crop. The crop thus grown should be turned under about thirty days prior to transplanting the celery, plowing the soil at least ten inches deep. Follow this with a light irrigation to settle the soil, and hasten the decay in the clover. A much better stand is secured by two irrigations, and by so doing the soil is thoroughly settled, clover is decayed and the soil will hold the moisture much longer, giving young plants a good start before the moisture goes down.

Irrigation.

Celery should be irrigated with great care, as I believe more celery is ruined each year by careless irrigating, or for lack of same, than by any other one cause. Taking the crop from the time it is transplanted, an even moist soil should be maintained, allowing the water level to lower as the celery advances; in other words, keep the roots of the celery going downward seeking the moisture. This will have a tendency to make a strong, healthy root that will support the plant a great length of time without irrigation, and this is what we want, as too frequent watering causes the roots to spread out on the surface to be torn up by the cultivator, and dry out if neglected a few days, when in need of water. Under these conditions the main root is very small and nourishment is furnished almost entirely by surface roots. This might be all right if a quick growth was desired; but in California the prime object is to grow a plant that will hold a reasonable length of time after maturity, as market conditions are not always favorable and many other difficulties arise in which it is necessary to hold the crop in a semi-dormant state, so to speak. The tile system of irrigating and drainage has proved to be the best, as absolute control of the moisture is possible under adverse conditions. A main line should be laid around the field with laterals every sixty or seventy feet and connected at each end. Gates should be installed at frequent intervals in the main, so that the water can be held at any depth desired in the summer. Artesian wells should be connected with the main lines at the highest points in the field, and when necessary to raise the moisture it is a matter of only a few minutes time to turn on the wells and close the gates, as desired, and wait for results. By this system any portion of the field can be irrigated independent of the other. This system is, of course, used for drainage during the wet season.

Black Heart.

Black heart in celery is caused either by extremely wet or extremely dry alkali soil. Alkali in the soil is the primary cause and when the soil is allowed to become extremely dry the alkali works upon the roots of the celery to such an extent that the head or heart of the plant becomes diseased and rot follows. The extremely wet condition acts in the same manner, as when the soil has become filled with water the alkali is forced to the surface, and when allowed to stand a few days the roots are naturally killed and black heart takes place. You may enter into any field of celery you like, and if black heart is found at all it will be in the extreme low or the extreme high places. Notwithstanding the condition of the celery in these places, you will find healthy celery in places where the soil has been kept in an even moist condition. This alone is sufficient to prove my assertion.

Relief.

Level the land to a grade, as mentioned in the beginning, so that there will be no high places to dry or low ones to flood. Water will seek its level and you must grade your land to conform with the water level. Then keep the soil medium moist through the growing season and drained as well as possible during the rainy season.

Of course the only perfect and permanent remedy lies in eradicating the alkali, and the only known method of doing this is by tile drainage.

Rotation of Crop.

Now that beets and beans have proven to be good paying crops, the farmers have a rare opportunity to improve soil conditions here, and one dovetails into the other with perfect accord.

Beets cannot be grown successfully after celery for the reason that a celery crop comes off too late. Beets should be planted in January or February and the soil plowed in the early winter, while the usual crop of celery is not harvested until the first of March. However, beans seem to be just the crop we have been looking for; planted at the time they are, during May, gives the farmer ample time to prepare the ground in A 1 condition, and it has been demonstrated that beans yield

Live Stock and Dairy

By Mrs. Minna E. Sherman

THIS TIME OF THE YEAR.

THE importance of a little shelter for cows during the rain storms is often overlooked. Shelter saves feed. A livery stable man pleaded with me to give him room in the pasture for one or two of his tired horses. I said to him the only pasture available was that of the yearlings; it was bermuda grass and they received a little cheap hay with it. He replied, "The shelter from the high winds and rain storms is more than feed." He had learned by experience the value of a few trees and a shed in the field. The cows do well if they have a covered place to go into, rather than being tied up in the barn. A wide shed closed on the higher side, with closed ends but open in the front; ground covered with clean sand and then the straw bedding, makes a comfortable shelter for them. If this is too expensive, at least build a shed with a brush roof or one covered with leaves. The palm leaves can usually be secured merely by hauling them home.

Colds.

Cows giving milk are more tender than beef animals. If they stand in the wind while wet they are apt to chill. Frequent letters are received about garget, as well as cows off their feed, which are usually caused by allowing them to take cold.

There is a cow on the other ranch that has a caked udder from neglect; she came in fresh and will have to be hauled home today or tomorrow. Alex can hardly wait; he is anxious to have her where he can care for her properly. This cow is one of those blue cows that come from a cross between the short horn and Holstein. They are good cows and could be raised into a strain as they breed nearly true to color, even now. Nearly every breed comes from some one's preferences in breeding at first.

Sorghum.

The prejudice against sorghum continues, yet our horses and cows, pigs and fowls are eating the second growth so fast that they are fairly chewing it out of the ground. We save our own seed and are getting it cleaner each year from mixtures. The heads are cut from a half acre and cured on the large fruit trays. The men cutting the heads take them clean from the piece and the stuff is assorted at threshing time. We have a little seed of brown Dhoura, Broom corn, white and red Egyptian corn and considerable kaffir. These are non-saccharine varieties and have hard woody stalks that are little value as fodders. The grains of dhoura are valuable for the chickens, but not liked by them as well as the Egyptian corn. The Egyptian corn crop seems to be an utter failure in nearby places this year; the chicken men are having to substitute all sorts of things in its place.

Beauty.

The ranch is full of pictures this time of year, the yellow pumpkins with the brown stacks of corn, while the vines and peach trees are brilliantly red. The golden leaves of the poplars and cottonwoods are slowly falling, but only to brighten the ground. The sun seems to gild everything as it touches out the yellow tones. Under the trees and in the shade everywhere the deep blue haze hangs. Nature seems to pause to count up the richness of the harvest. Everything should be golden, for the work has been earnest and truly done. The quail start out of the vines with a whirr as they fly further on from the intruder. They too are in earnest in flying to escape the gunners.

In Fresno county the farmers have much to be thankful for in the long continued warmness of the season. The raisins are still stacked in the vineyards waiting for the election to decide the prices and wake up the market. With raisins unsold and other grapes hardly worth picking, the Thanksgiving day finds us at least thankful that one more installment of the taxes has been paid.

Young Stock.

The young stock on the ranch must be looked after during the next three months or until grass comes again. A little extra feed if they are losing condition will make a great difference in their growth. It should be an axiom to keep everything growing that will grow. It is as bad to stop an animal's growth as it is to stop the growth of a vineyard or orchard. We have brought up heifers that were springing and put them in with the cows. They grow gentle from the association with the older cows. They also learn to be driven in and out twice a day. The friendships that exist between animals are nearly as strong as those formed by people. They will not grow panicky if they know the rest of the herd well.

Feed.

The young heifers should be fed well and come in to the milk string in good condition. They will give back the feed in the increased milk. One reason that people have to count the heifers as giving only half the milk of a cow, is that they have merely given them a maintenance ration. The last months of a heifer's life she should be fed all she will eat of succulent feed. Push them with feed and secure the extra profits that will come from the first year's milking. More than that, however, is the securing of the habit of milk making. The udder is undeveloped and it is really enlarged if the blood supply is sufficient to do it.

Milk Fever.

While this is no longer a fatal disease owing to the discovery of distending the udder with air, it should be prevented rather than cured. The trouble is caused by collapse and chill. These can be prevented by not drawing off all the milk in a cow's udder for twenty-four hours or more after calving. Milk enough to keep down distention. Then after the second day she may be milked out clean. Never let any inflammation arise from too much distention and when the shock of the calving has passed she will be past all danger of milk fever.—M. E. S.

One miners' inch equals nine gallons per minute, or practically 13,000 gallons each 24 hours.

A miners' inch is equal to one-fiftieth part of one cubic foot per second constant flow.

Owners of Live Stock in California Should Insure in Their Own Association,

THE CALIFORNIA MUTUAL LIVE STOCK INSURANCE ASSOCIATION

BECAUSE . . .

It is the only institution of the kind organized under the laws of California with the home office in this State.

We insure live stock against death from disease, fire, lightning, tornado, cyclones and every casualty; also through accident which may necessitate the death of any animal.

Losses are paid promptly without discount and without unnecessary delay.

We have a guaranty deposit under the control of the State Treasurer for the protection of our members and policy holders.

There is $100 of values lost to farmers by death of stock, by disease and accident, where $1 is lost by fire.

We have no dividends or profits paid to idle office holders.

The business of the Association is conducted as economically as is consistent with good management, and the earnings are divided among the policy holders.

This is an age of Mutual Insurance, and it is true the cheapest and strongest companies in the United States to-day are composed of and managed by the policy holders, who are farmers and stockmen, as has been demonstrated in the East.

The directors and officers are elected annually by the policy holders.

WHY PAY LARGE PREMIUMS FOR PROFIT TO EASTERN COMPANIES WHEN YOU CAN CO-OPERATE WITH YOUR FELLOW FARMER AND STOCKMAN AND SECURE YOUR INSURANCE AT COST?

A Few of the Many Testimonials We Are Receiving Daily:

Fresno, Calif., August, 29, 1908.

California Mutual Live Stock Ins. Ass'n.,
Los Angeles, California.

Gentlemen:—

We are in receipt of your check for $150, indemnity for the loss of one horse.

We had upon investigation found that your application and by-laws were not complicated, were easy to understand and did not contain so many technicalities as some companies we had investigated that are doing business from foreign states. We also found that this was the only company organized under the State laws of California that was writing live stock insurance in this State. We therefore insured our stock and would not under any consideration do without insurance in your company.

We are more than pleased with the promptness with which payment was made for this loss.

Yours respectfully,
JOHNSON & GREENING.

Los Gatos, August 6th, 1908.

To Whom It May Concern:

This is to certify that I sustained a loss in the California Mutual Live Stock Insurance Association, of which I am a member, to the amount of $350, by the death of two horses. Thanks to the promptness of the Association I have this day received payment in full, through their State agent, Mr. F. H. Hilliker, and cheerfully recommend the Association to all.

I consider it safe, prompt and reliable and an association that all farmers and stock men should go into, as it furnishes absolute protection at cost.

Very respectfully,
FRED LARDER.

Cal. Mutual Live Stock Ins. Ass'n., Newcastle, August 20th. 1908.
Los Angeles, Cal.

Gentlemen:—

Your General Agents, Messrs. Allen & Hunter called on me to-day and handed me your check for $150.00, payment in full for the loss of one of my horses. I certainly appreciate the promptness with which you have met this claim, and I consider it a very good plan to insure our stock against loss by death the same as other property.

I will recommend your Company to my friends.

Wishing you success, Yours resp'y,
RALPH BARNICOTT.

DEHORNING.

Every little while there appears in the Cultivator a paragraph of advice about dehorning, but they hardly seem to be written by those who do it. Permit a few remarks, because "I want to know, you know."

One says you must do it before the calf is three days old; another says "two weeks" is the proper time; another says "three weeks."

These writers recommend caustic potash. Only one of them says "lunar caustic, sometimes called caustic potash." And away flies our budding confidence, for are not these two totally different things?

A fourth doctor tells us to use a sharp knife as well and repeat the operation every second day. He does not say for how long. We had begun to hope that if you only "press the button" with the caustic the job is done.

I have been trying it on a kid three days old. Did it every second day for twelve days. It seemed to bother him more or less, but the sturdy hornlets kept a-coming. The drug store man, when cornered, blushingly owned that his caustic was probably N. G.

The writer in Home and Farm quoted Sept. 17, opines that the sawing off of horns is painless, because the horn "was made to fight with and not at all sensitive." Similarly teeth are made to bite with, and that is why we are "not at all sensitive" about going to the dentist to have one sawed off. I do not know, but I let a man who had dehorned whole bunches of cattle saw the horns off a three months' kid, (they were three inches long,) and besides the terrible outcry she made at the time, her beautiful eyes were dim with pain for ten days after, and she would crawl into dark places and hide all day long. It was a weary while before she was herself again. This man told me if you dehorn an animal very young you make a "bunter" of him. If you do it after the horns are grown you tame him, because he feels he has lost something. If sawed off close to the head they bleed very little; if taken higher up may bleed very badly.

One of my earliest impressions is that of hearing how a muley bull—a "polly bull" they called him in Norfolk, England—had killed his keeper.

Recently a friend had a fine mare gored nearly to death in his own yard by a neighbor's mean bull. The boys ran that bull into the cow barn and made a "polly" of him before they sent him home. Good enough for him. I would certainly prefer the dehorning done as young as possible, and though it probably hurts, old or young, it can't hurt as much as the way they use them when at mischief. May we not have a good working recipe from some one who does things? And tell us how to know when we have done enough.—B. A. R. S.

Of course lunar caustic and caustic potash are two entirely different substances and should not have been given in that way. However, here is a method of procedure given in a former Cultivator and taken from the government report on the Diseases of Cattle:

"The operation is performed as follows, and is uniformly successful, if performed before the calf is three days old: The little animal is caught and gently laid over on its side, in which position it is easily held by one assistant while the operator clips the hair off the trifling prominence on the frontal bone which marks the spot on the uppermost side of the head where the horn would be developed if not interfered with. He then takes his stick of potash, dips it in cold water, and carefully rubs it over the part just clipped for the space of, say, ten seconds. The calf is now turned over, the corresponding portion of the frontal bone on the other side clipped and thoroughly rubbed with the moistened potash the same way as the first. By this time the side first treated is dry and ready for a second application of the caustic, which should conform exactly to the first. Follow the same procedure on the remaining side, where the matrix of the embryo horn has been located, and if the caustic has been properly applied no horns will ever make their appearance."

As to dehorning a kid, that is a new one and we question as to whether it has been practiced.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

INTERNATIONAL LIVE STOCK EXPOSITION.

The organization of the International Live Stock Exposition at Chicago was one of the most important events in the history of the development of the live stock industry.

In December, 1907, there were on exhibition at this great show 7523 of the finest meat and draft animals in the world, contributed by twenty-two states, one territory and four foreign countries.

These animals were entered in competition for more than 2400 premiums, aggregating over $75,000.00, offered in upward of 600 classes of cattle, horses, sheep and swine, besides packing house and other interesting exhibits, all of which were viewed by fully 400,000 visitors from nearly every state in the Union and foreign countries.

No such object lesson in everything which pertains to excellence in the breeding, feeding, marketing, manufacturing and distributing of animals and animal products was ever previously placed before the producers and consumers in this or any other country.

The object of this movement is to secure better animals for breeding, marketing and exporting, thus encouraging greater consumption of American animals and meats at home and abroad.

The next annual exhibition will be held November 28 to December 10, 1908, in the International Amphitheatre and about twenty adjoining buildings at the Union Stock Yards, Chicago.

MILK AND CREAM CONTEST.

The Dairy Division of the United States Department of Agriculture will conduct a Milk and Cream Contest which will be open to all dairymen in the United States. Space has been alloted for the use of the Dairy Division in making the exhibit. The first contest of this kind was held in connection with the National Dairy Show, Chicago, February 15-24, 1906, under the direction of the Dairy Division. Milk and cream was sent from 13 different states and much interest was shown by the dairymen and it proved to be a valuable educational feature. Results were published as Bulletin 87, B. A. I., U. S. Department of Agriculture.

Since the first National contest several states have had similar exhibits, including New Hampshire,

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Isn't It More Sensible

to examine an article before buying, than to take for granted the merits claimed for it?

Of course it is.

That's the way we sell the

Tubular Separator

Furthermore, we assist you in the examination by explaining the mechanism thoroughly.

The simplicity of the Tubular is exemplified in its entire construction, its durability is guaranteed by us and vouched for by satisfied every day users; and its efficiency proves itself, immediately, upon using.

To prove these merits try a Tubular and be convinced.

Catalog 260, explaining fully the entire mechanism, sent free for the asking.

Pioneer Rubber Sanded ROOFING

The Roof that "proves," sun-proof and rain-proof; needs no paint or repairs. Following are a few "Wont's" about Rubber Sanded Roofing:

Won't chip. Won't warp.
Won't tear. Won't crack.
Won't rust. Won't decay.
Won't shrink.
Won't crumble.
Won't need repairing.
Won't absorb moisture.
Won't attract electricity.
Won't need any paint to preserve it.
Won't be affected by any climatic changes or conditions.
Won't cost as much, in the long run, as other roofing.

What Rubber Sanded WILL do is told of in our booklet "ROOF TALK," which will be sent free upon request, together with samples of the Roofing itself.

Antelope Valley farmers are working for an institute to be held as soon as arrangements can be made.

Ohio, Connecticut, Illinois, Missouri, Massachusetts, Pennsylvania and Michigan. The city of Cleveland, Ohio, has also held two such contests. The object of this contest is educational and entirely for the benefit of the dairymen. The milk and cream will be carefully analyzed and scored by experts from the Department of Agriculture. Forty points will be allowed for flavor, 20 for composition, 20 for bacteria, 5 for acidity, and 10 for appearance of package and cleanliness of milk. Any defects will be pointed out in the score and dairymen will have opportunity to learn whether by the methods they are using they can produce a standard product.

There will be four classes in this contest, as follows:

Class I. Market milk (raw) two prizes (gold and silver medals.)

Class II. Market cream (raw) two prizes (gold and silver medals.)

Class III. Certified Milk (raw) two prizes (gold and silver medals.)

Class IV. Certified Cream (raw) two prizes (gold and silver medals.)

Milk and cream receiving a score of 90 or above will be classed as excellent. After being scored, the product will be placed on exhibition accompanied by the score.

For further particulars relating to the contest, address the Dairy Division, U. S. Department of Agriculture. Washington, D. C.

STOPPAGE OF THE BOWELS IN CATTLE.

This is one of the most common ailments that cattle are subject to; at the same time more cattle die from this cause than any other, for the simple reason that stoppage is due to paralysis of the bowels.

Stoppage of the bowels is to be regarded as a sign of another disease rather than a disease of itself. It occurs in almost all fevers, indigestion and over eating.

In order to overcome stoppage of the bowels a treatment must be applied to overcome the ailment which causes it, such as paralysis of the bowels. Seventy-five per cent of the cases of stoppage of the bowels are due to partial paralysis of the bowels. In this case the bowels require a laxative and tonic and not a physic, for if the bowels are paralyzed a physic will have a tendency to cause irritation, indigestion, inflammation, and death follows. For this reason it is dangerous to give a cow salts or oil.

A cow thus afflicted should be given a laxative and tonic, plenty of drinking water, with the chill taken from it, bran mashes made of flaxseed tea, also inject several quarts of warm water once or twice daily through the rectum by the use of the hose funnel, and give the animal a reasonable amount of exercise.—Dr David Roberts, Wisconsin State Veterinarian.

OF VALUE TO HORSEMEN.

Do you turn your horses out for the winter? If so, we want to call your attention to a very important matter. Horses which have been used steadily at work, either on the farm or road, have quite likely had some strains whereby lameness or enlargements have been caused. Or perhaps new life is needed to be infused into their legs. Gombault's Caustic Balsam applied as per directions, just as you are turning the horse out, will be of great benefit; and this is the time when it can be used very successfully. One great advantage in using this remedy is that after it is applied it needs no care or attention, but does its work well and at a time when the horse is having a rest. Of course it can be used with equal success while horses are in the stable, but many people in turning their horses out would use Caustic Balsam if they were reminded of it, and this article is given as a reminder.

MAKING AND SELLING
A MILLION

CREAM SEPARATORS
AND THE KNOWLEDGE GAINED

Thirty years ago Dr. De Laval invented the first practical centrifugal cream separator. Since that time the De Laval Separator Company has manufactured and sold one million DE LAVAL machines. These separators are today in use in every civilized country in the world. They have been operated and criticized everywhere. Through all these years suggestions for their improvement have come by the thousands from every quarter of the globe. These have been investigated and tried out from time to time. The best have been adopted. The 1908 improved DE LAVAL cream separators represent the thirty years accumulation of such ideas and experiences. They represent the knowledge and experience gained through the manufacture and sale of one million machines. If in your lifetime you had milked one million cows, wouldn't you feel that you knew how to milk a cow just a little bit better than someone who had milked but one thousand? That's the way we feel about the cream separator. Our knowledge of its manufacture and practical use is many times greater than anyone else's. If you are thinking of buying a separator can you afford to ignore the knowledge gained by making and selling a million separators? We don't believe you can. We offer you the 1908 DE LAVAL for your most critical examination. An illustrated catalogue will be mailed for the asking. Write for it today.

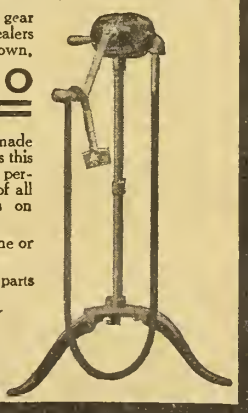
Clip Your Horses

with this superb **Stewart No. 1 Ball Bearing Clipping Machine**

The great enclosed gear machine at your dealers all complete, as shown,

only **$8.50**



No machine ever made at any price equals this one. It is the most perfect in every way of all clipping machines on the market.

It turns easier, clips faster and lasts longer. If you have but one or two horses it will pay you to have this splendid machine.

The gears are all cut right out of the solid bar, and all wearing parts are file-hard. It will last a lifetime.

If your dealer hasn't it, write us direct. GET ONE NOW

Chicago Flexible Shaft Co. Dept. H, **Chicago**

Red Cross Wind Mill
Is built right, Works right. Runs in light wind. Has ball bearing turntable and outer thrust. Easy mill to set up and take care of. Built upon honor.

FARMERS' INSTITUTES.

J. B. Neff, Conductor of Farmers' Institutes for Southern California, reports institutes for the following places and dates: Rosedale, Kern county, November 16-17; Panama, Kern county, November 18; Wasco, Kern county, November 19; Lancaster, Los Angeles county, November 21; Hemet, Riverside county, November 30 and December 1; Beaumont, Riverside county, December 2; Banning, Riverside county, December 3; Thermal, Riverside county, December 4-5 Holtville, Imperial county, December 7; El Centro, Imperial county, December 9; Imperial, Imperial county, December 10; and Brawley, Imperial county, December 11.

The institute at El Centro on the afternoon of December 8 will adjourn to attend the dedication of the Heber Collegiate Institute.

GOOD MATERIAL IN THE CULTIVATOR.

Readers who are interested in grape vines found a fund of valuable information in the article written by Mrs. Sherman and printed in last week's Cultivator. Another installment appears in this week's issue and still another on the care of the vineyard will appear next week. These are very valuable articles because they are produced from a fund of information gathered by hard practical experience in the vineyard. Mrs. Sherman is not only a pleasing writer but gives most valuable information as well.

By the way, it may be in order to call attention to the many good things which the Cultivator has recently given. The question department alone seems to be attracting more attention and the great number of questions coming seems to increase every week. The account of the Farmers' Institute at Davis was more extensive than any other paper's and was secured by one of the regular Cultivator staff attending the institute. Prof. Smith's Tomato Blight article was also most valuable. This week Leonard Coates of Morganhill has an article on Eucalypts which contains a fund of information. This will be followed by later articles which will be illustrated by photographs taken especially for the Cultivator by Mr. Coates. Owing to the great interest in the Eucalypts at this time these articles will have exceptional value.

If our readers will speak to their neighbors and pass the word along as to the good work the Cultivator is doing, it is possible that our family may increase so that more and more of these good things may be secured.

CO-OPERATION.

The failure of the old raisin association in its efforts at co-operative marketing has sometimes been pointed out as an example, or proof rather, that co-operation is a failure. We think it is nothing of the kind but do think it is proof that our selfishness sometimes overreaches itself and defeats the very thing that would bring to us profit.

In this case some of the raisin growers had been advanced funds in excess of what their raisins brought, while others secured nothing or only a portion. When the season ended and this was conclusively shown, those growers who were overpaid refused to refund that which was not theirs. Of course no body of fruit growers or other producers will ever succeed in co-operative effort when such a spirit as that is manifest. It simply becomes an effort to secure legal advantage and throws discredit on every future effort along the same line.

Another possible cause of the failure in this case was the fact that the producers were not the only factors engaged in the effort. There were packers and other interests which had ends to accomplish which were not looking to the best advantage of the producers. The California Fruit Exchange is organized as a body of producers only, no outside interests being allowed to have any connection whatever with the movement. It has succeeded but it has not been without some giving way on the part of those whose interests have at times seemed to be atagonized. That is, averages have been struck so as to benefit the greatest number of producers. This has succeeded until this organization is pointed out as the greatest co-operative marketing effort the world has seen. That the raisin growers might have one equally as effective goes without saying if they will follow the principles of business and not allow a disposition on the part of any faction to secure advantage at the expense of another.

FARM CONDITIONS.

"The farmer is, as a rule, better off than his forebears, but his increase in well-being has not kept pace with the country as a whole. While the condition of the farmers in some of our best farming districts leaves little to be desired, we are far from having reached so high a level in all parts of the country. In portions of the South, for example, where the Department of Agriculture, through the Farmers' Co-operative Demonstration Work of Doctor Knapp, is directly instructing thirty thousand farmers in better methods of farming, there is nevertheless much unnecessary suffering and needless loss of efficiency on the farm. A physician, who is a careful student of farm life in the South, writing to me recently about the enormous percentage of preventable deaths of children due to the unsanitary conditions of certain Southern farms said:

"'Personally, from the health point of view, I would prefer to see my daughter, nine years old, at work in a cotton mill, than have her live as a tenant on the average tenant one-horse farm. This apparently extreme statement is based upon actual life among both classes of people.

"'I doubt if any other nation can bear comparison with our own in the amount of attention given by the government, both federal and state, to agricultural matters. But practically the whole effort has hitherto been directed toward increasing the production of crops. Our attention has been concentrated almost exclusively on getting better farming. In the beginning this was unquestionably the right thing to do.'"—President Roosevelt to Professor Bailey.

IRRIGATION CONGRESS REPORT.

Chairman W. A. Beard and his committee at Sacramento have made good by issuing a most creditable report of the 15th National Irrigation Congress. It required nearly a year in the making and for a time caused the feeling that Sacramento hardly came up to the expectations of the remainder of the state in the long delay which it permitted after the Congress adjourned.

We congratulate the committee on the issuance of this valuable report. It has much of value, practically and historically.

STATE FRUIT GROWERS' CONVENTION.

State Commissioner Jeffrey writes us that the program is nearly ready for the coming Fruit Growers' Convention and that things will be doing in Sacramento from Tuesday morning, December 1, until the next Friday night. As soon as the full program is out our subscribers will be informed of the further plans.

President Roosevelt has issued his annual Thanksgiving Proclamation setting apart Thursday, November 26 as a day of thanksgiving. In it he says:—

"The thirteen colonies which struggled along the seacoast of the Atlantic and were hemmed in but a few miles west of tidewater by the Indian-haunted wilderness have been transformed into the mightiest republic which the world has ever seen. Its domains stretch across the continent from one to the other of the greatest oceans, and it exercises dominion alike in the Arctic and tropic realms. The growth in wealth and population has surpassed even the growth in territory. Nowhere else in the world is the average of individual comfort and material well-being as high as in our fortunate land."

The Counties Committee of the California Promotion Committee, holding its meeting in Los Angeles this week, discusses the question of the tourist in California. The farmer may feel that this does not concern him, but we believe the tourists attracted here by California's climate add not a little to the general prosperity of the state. The general prosperity of the state adds not a little to the welfare of the farmer. Therefore, the attractive roadsides and beautified homes aid in drawing this class which means much to us. Let the farmers accept the hint and make rural surroundings attractive to the cultured people whom we wish to come here.

Mr. C. R. Paine, of Crafton, has suggested a novel insurance plan for citrus orchardists which will result in destruction of scale and marketing of clean fruit if carried out. It is to insure against smutty fruit or injury of tree from insect pests. It is to be co-operative and the company carrying the insurance is to stand good for any loss that may occur from the ravages of any insect pest.

Imperial county has settled down to do business in a staid and regular way and develop its great agricultural resources. An effort was made at one time to upset the results of the election making the county seat at El Centro. This suit has been called off and all have agreed to get busy to develop and boost.

The Santa Clara Valley Poultry & Pet Stock Association unite pleasure with business and at their monthly meetings not only talk upon poultry but feed upon it, having refreshments served and a general social time. It is a plan worth following.

Plans are now forming for the next annual meeting of the American Forestry Association, the date of which has been fixed by the Executive Committee. The meeting will be held in Washington on January 13, 14 and 15, 1909.

The census shows in the United States 25,258 flour-mills, with $218,714,000 capital, employing 37,073 workers, paying $1,703,418 a year in wages and $10,325,583 for miscellaneous expenses, spending $475,826,345 a year for materials, and turning out products worth $560,719,000 a year.

Agricultural Notes of the Pacific Coast

Northern California

A creamery is to be erected at Cedarville, Modoc county.

A large hay storage warehouse was recently burned at Woodland.

Gridley, Butte county, is producing some exceptionally fine figs this year.

The California Creamery Operators Association is in session in San Francisco this week.

The Chamber of Commerce, Oroville, has postponed its plans for a Butte county citrus fair.

A feature of California exhibits at the Alaska-Yukon Fair will be a display of almonds from Yuba county.

Professor Roberts,, formerly of Cornell University, delivered several lectures on Plant Food at the University short course at Davis.

The tuberculin test which is being made in the dairies around Santa Rosa has made evident that tuberculous cows are in nearly every herd.

Five hundred tons of raisins have been shipped from College City, Colusa county. This is about a third less than was shipped last year at this date.

Manton, Tehama county, has produced some exceptionally fine prunes this year. The fruit has to be freighted to Red Bluff where it is shipped by rail.

A meeting was recently attended by many farmers at Knights Landing, Yolo county, to discuss a large drainage scheme covering several thousand acres of that county.

The Western Creameries Company of San Francisco and the American Creamery Company of Oakland have consolidated their interests and will be run under one management.

A government expert has harvested a sample of rice grown on the adobe land west of Biggs, Butte county, and has declared that such land will yield 35 to 40 bushels of fine rice per acre.

The Grape Growers Association of California has decided to extend its campaign for the protection of the interests of its growers by securing members in the southern end of the state.

The International Eucalyptus Association of California with headquarters at Sacramento is erecting a lath house and planning to grow at least two million young trees this season.

This has been a record breaking season in the matter of green fruit shipments from the Sacramento valley. The total amount of fruit passing through Sacramento has aggregated to date nearly 11,000 cars.

The sweet wine men have won in their effort to secure a concession from the recent ruling of the Department of Internal Revenue, that the sweet wines should not be used as a medicinal component.

At a recent meeting of the Sonoma County Poultry Association held at Petaluma, the following officers were elected for the coming year: President, Walter Church; vice-president, Jacob Killam; secretary, W. L. Sales; treasurer, A. Lenoir; Enforcement Committee, Messrs. Hofeldt, Robinson, F. Rotthaus and J. Ronsheimer; finance committee, E. Pederson, J. Rosheimer, J. Killam.

Central California

Santa Clara County Poultry and Dog Show is being held in the Auditorium Rink at San Jose.

Inspectors are after the sellers of milk at Watsonville for selling milk of too low a grade.

Lindsay orange growers have agreed to pay at the rate of 25 cents per hour for orange picking.

Poultrymen at Hanford are planning for their annual poultry show to be held at some date to be determined in December.

Horticultural Commissioner Fowler of Tulare county has nearly finished work of fumigation of town lot trees in Visalia.

The Pajaro valley has been shipping some exceptionally fine qualities of Bellflowers this year and has secured good returns.

One of the Watsonville apple packing houses has a box making machine which will manufacture 10,000 boxes in a 10 hour day.

Kings county bee men recently made a sale of 6 car loads of honey to the Guggenheim company. The price reported is 4¾ cents per pound.

The rabbit pest is increasing in San Joaquin valley and a rabbit drive similar to the one recently held at Delano will probably be planned in other sections.

The grape root worm is said to be doing much damage in the vineyard region about Lodi. It is feared this pest may prove a serious enemy to the grape industry.

A Pajaro valley apple packers association recently met at the Chamber of Commerce in Watsonville to discuss the matter of securing lower freight rates on apples.

A breeder of Merino and Rambouillet sheep at Hanford is breeding in such quantities that he has shipped this season several carloads of rams to Texas and Mexican points.

The new pool of raisin growers formed at Fresno which is determined to hold raisins at four cents per pound gives assurance to growers of a better price if they will but stand pat.

Beemen of Kings county recently held a conference at Hanford and discussed the question of securing better prices for the product. Kings county produces about 75 tons annually.

The Consolidated Eucalyptus Company of Fresno has purchased 1000 acres of land between the Santa Fe and Southern Pacific railroads in Madera county and will plant to Eucalyptus.

Five four-horse teams could have been seen recently hauling tomatoes from one ranch near Hollister. On this ranch there are 130 acres of tomatoes. The output was over 1000 boxes per day.

It is now claimed by some that the great number of deaths of ducks in the Tulare lake section was caused by wholesale poisoning. Wheat soaked in Paris Green is claimed to be the cause of the deaths.

Some members of the old raisin association are paying back the excess money which was paid them several years ago. This action is caused by the recent court decision that it is a valid claim against them.

Southern California

Farmers' Institute will be held at Thermal December 4-5.

The Tri-counties Reforestation Committee recently met at Santa Ana.

Southern California is busy shipping its $2,000,000 worth of walnuts.

One bean thresher near Oxnard in 32 days threshed 50,443 sacks of beans

First flower festival at Whittier closed recently and is pronounced a big success.

Southern California will ship very few oranges for Thanksgiving or Christmas trade.

Rialto, San Bernardino county, is erecting a new packing house for the storage of lemons.

An orange grower of the island of Porto Rico is inspecting fruit growing and fruit packing at Redlands.

Land company at San Fernando will put out a large acreage to Valencia oranges the coming season.

Orange county will send about 800 carloads of celery east this year. The first shipment will go forward tomorrow.

Coachella valley people are discussing the advisability of taking steps to make the Salton Sea a perpetual feature.

Imperial valley will plant far less cantaloupes than last season. Some have predicted that the crop will be exceedingly short.

The California Fruit Exchange will handle 60 per cent of the output of oranges and lemons of Southern California for the coming year.

Hemet fruit growers want a cannery and offer to subscribe liberally for stock if a responsible and experienced man can be found to manage the business.

The red scale has secured a better foothold during the last year in Orange county and efforts are being put forth by fumigation towards its more complete eradication.

The forestry service has appropriated $5000 for work in the San Bernardino Forest Reserve which is to become available upon a state appropriation of like amount.

The Horticultural Commission of Orange county reports that Scutellista cyanea is doing excellent work on the black scale and in some sections has almost eradicated it.

Highgrove has a new association in the Sugar Loaf Orange Association. Its officers are: President, F. M. Ryon; vice-president N. H. Twogood; secretary, and manager, E. F. Wolever.

Ventura county output of honey will this year be rather lighter than ordinary, but it is claimed that San Diego, Imperial, Riverside, Orange, San Bernardino and Los Angeles counties will produce up to the usual amount.

Brawley Cantaloupe Growers' Association at its annual meeting endorsed the aims of the Imperial Valley Produce Exchange and decided that all renters of melon land who come in must pay cash in advance or give security for crates and other needful things used in shipping. Directors elected for the coming year are: Peter Hovley, W. H. Best, J. J. Miller, A. W. Applegate and C. M. Stahl.

The Coast

Milton, Oregon, is proving to be a most successful apple producer.

All the fall has been extremely dry in the farming sections east of the Rocky Mountains.

An evaporated milk plant to cost $150,000 is to be built at North Yakima, Washington.

The annual meeting of the Oregon State Dairy Association will be held at Salem December 10-11.

The next Oregon legislature will be asked to make an appropriation for the inspection of dairy products.

Fall spraying for San Jose scale has been more generally engaged in in Oregon this season than ever before.

Some Rogue River Valley pears shipped from Medford, Oregon, recently, netted the neat sum of $6.60 per box.

Government crop reports show the condition of Arizona oranges to be 94 per cent as compared with 100 per cent in 1907.

A $3,000,000 tunnel will conduct water to reclaim 100,000 acres of land in the Henrylyn district, near Denver, Colorado.

The date of the National Apple Show at Spokane is December 7th to 12th. There will be $35,000 offered for premiums for apples.

A mid-winter sheep show is to be held at Pocatello, Idaho, January 14-15, in connection with the National Wool Growers' Association.

Utah is the latest to enter the field with the modern farmers' institute train, railroads there having been asked to supply exhibit cars.

Eggs in Portland, Oregon, are now selling for 40 cents per dozen. The Portland market is stronger and nearly all stock has been cleaned up.

Many newcomers to Arizona are entering into orange growing, and it is claimed rich reward will be given to the citrus people of that section.

Many sections of Klickitat county, Washington, which have heretofore been grazing and grain lands are now coming into prominence as fruit sections.

Denver health inspectors are becoming very active since a recent typhoid fever scare. All dairies about the city have been put on a much cleaner basis.

Business men of Phoenix, Arizona, are considering a plan of reclaiming a vast section of land by irrigation, which will bring many families to that territory.

A dairy experimental train recently made a journey through Western Montana, giving instruction in scientific dairying to farmers. It was proclaimed a complete success.

British Columbia apple growers are having much trouble this fall with a disease which they call "pink rot." It seems to affect all the apples which are infested with apple scab.

There seems to be a contest on between North Yakima, Washington, and Hood River, Oregon, as to which commands the highest price for its fruit lands. Hood River recently made a sale of 10 acres for $16,000, which it is claimed is the highest price ever received in either section.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Egg-More

is not a strong tonic and stimulant, but a highly nitrogenous, concentrated Poultry Food, very rich in protein. A little fed with good grains will keep hens healthy and make them lay lots of eggs. Have you tried it? Many have and are pleased. Here is just one:

F. W. Healy, the well-known banker and fancier of Pasadena, writes: "After hearing others praise Egg-More, I determined that if there was anything to keep hens laying through the fall and winter months, I wanted it. I bought a package of Egg-More and fed it and the improvement was very marked. Keeping on with it I soon proved the truth of your statement that 'you can't put all your eggs in one basket if you feed Egg-More.' I have raised poultry nearly all my life and for twenty years in California, but never did my hens lay so well as since I began to use Egg-More. I consider it the best egg producer on the market, and I do not intend to be without it."

You better try it. For sale by many dealers at 12½ lbs $1.00; 25 lbs., $1.90; 50 lbs., $3.60. If not by yours we will prepay freight on sack within 400 miles.

West Coast Mill

707-709 So. Griffin Ave., Los Angeles, Cal.

Coulson's No. 3 Condition Powder

Is just the thing for molting hens. It acts as a tonic and digestive. Keeps the hens laying longer into the molt and quicker after it. Our FREE Booklet, "THE RIGHT WAY" gives full particulars and special offer. Manufactured only by

Coulson Poultry and Stock Food Company

Petaluma, California

Trap-Nested White Wyandottes

Eggs for hatching now ready from fall matings.

MISSION VIEW POULTRY RANCH, MRS. C. D. HUBBARD, SAN FERNANDO, CAL.

When writing advertisers, mention Cultivator.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

CHICKEN CHAT.

THE interesting time of the year has about arrived. We must select our show birds and fit them for exhibition. Many of you have been mating a long time with this end in view, and may not be sure whether your birds will score up well enough to justify your trouble and expense, and to these I want to say a word of encouragement: Select the best you have, after studying the standard of the particular breed you have, carefully, but do not expect to find 100 point birds, and do not be afraid to show birds that fall short in several sections, for the 100 point bird has never been hatched, and the game of the show room is "to beat the other fellow," and your good birds may chance to be the ones which will win the blue.

Selecting.

A Standard of Perfection is a necessary guide, and can be purchased at any store where poultry supplies are kept, or can be had of our own good editor at the regular price, $1.50. It may seem hard to have to buy the standards of all the breeds, just to get the one or two you want, but separate breed standards are among the things of the future, which the good old A. P. A. will give us in time.

In selecting, pay close attention to typical shape, as that is a very important point with most judges. At Niagara Falls iu 1907, at the meeting of the American Poultry Association, we had a very interesting and instructive chalk talk by Franklane Sewall upon the typical shape for a White Wyandotte. Now, all White Wyandottes look pretty much alike to me, and it was surprising to learn that only one perfect shaped White Wyandotte had ever yet been shown.

In selecting a Wyandotte for shape, have in mind a round ball, for this breed is all curves, and the outline resembles a ball more than any other breed..

In selecting a Rock, R. I. Red, Buckeye or Leghorn, have in mind an oblong, as they have longer keels and backs, giving length rather than roundness of outline. A study of the illlustrations in the Standard will make this clearer than any word-picture.

Shape satisfactory, weight must be considered next, and right here let me impress it upon your minds that over-weight will uot win, but the "bird coming nearest the Standard weights wins always." A tie between two birds will give the prize to the lighter weight bird, if that comes nearest the Standard weight.

Shape and weight having been decided, color comes next, and if a pen be selected, the females must be as uniform in color as it is possible to find them. Many times the birds will be imperfectly moulted. In such cases all old, faded, feathers must be carefully removed, so they may present a clean, fresh appearance.(This is legitimate, and does not come under the head of "faking.") Good head points count for a great deal, but I have seen birds that won the blue in "way down East" shows that had combs like nightmares, and enough white in earlobes to condemn them as breeders, yet those same birds "beat the other fellows" when it came to a count of points. So don't be discouraged, I say, but send them in and get them scored, and the lesson thus learned will repay you richly, whether you win a prize or not.

Washing.

In fitting dark plumaged birds no washing is needed, as a rule, excepting the feet and shanks, beak and combs. Two tubs of water will suffice for this, both luke warm. A basin containing a little water in which a few drops of spirits of camphor have been dropped is a good thing to prepare also.

The bird to be washed should be held firmly in the left hand by tucking its head under your arm, while you vigorously scrub its feet and legs with a soft brush, using plenty of soap and elbow grease until perfectly clean, even to the insides of the toenails. Then rinse thoroughly in the second tub, being careful not to wet the feathers, and rinsiug the head points, comb and beak, in the second tub which contains no soap, and giving a final dip into the basin containing the camphor water as a preventive to cold. All this should be done in a warm room. I usually take the birds into the kitchen, and have the coops all ready with clean straw or shavings in front of a warm stove, but watch that they do not get so warm as to pant.

I forgot to say, that the feet should be wiped dry with a soft cloth and rubbed with a drop or two of sweet oil to restore the gloss the soap removes. The feathers may also be wiped with an old silk handkerchief with good results.

White birds require much more of a bath—at least three tubs of water are needed, and a kettle kept boiling to replenish from, so as to keep up the temperature. Cne tub should contain good soapsuds, one clear water, the other water that has been blued as for rinsing clothes. The birds are given a thorough washing in the suds, working it well amoug the feathers, but always rubbing the feathers the way they grow, never backwards.

This is a tedious job for the beginner, but practice soon makes perfect, and the birds really seem to enjoy it, if carefully handled.

After you are sure every bit of dirt has been removed, lift out of the suds and wash just as thoroughly in the second tub, that no particle of soap may remain to smear and "yellow" the plumage. The legs and feet must be washed with a brush, just as for dark birds, and the final rinsing in the blueing water completes the bath. Now set your bird on top of a table or box, covered with a cloth, and with a sponge take up all possible surplus moisture, being careful not to muss the plumage by rubbing the wrong way. Dip feet, legs, comb and beak into basin of water with camphor in, at the last, wipe them dry, and oil slightly, then place your bird where it will dry slowly, free from dust and dirt drafts. Many fan their birds while drying, believing it makes them fluffier, but I think this dangerous, and prefer to have them dry slowly and allow them to preen their own

High Priced EGGS

Are what all poultrymen like to get during the fall and winter; but without the very best of health in the flock and a good variety of sound, wholesome feed it is hard to get such eggs.

Nature requires that hens have a rest just prior to and during the molting period; the result is a scarcity of eggs, with higher prices, and a larger profit for those who can overcome the difficulty. The one that can get eggs during the fall will be just that much ahead of his neighbors and others who fail to do so, which in the end is the difference between success and failure.

COULSON'S EGG FOOD is the feed that will turn failure into success by enabling you to secure eggs in the fall and winter while prices rule high.

Improvements have been effected in the composition of the EGG FOOD during the past year, so that it is now richer in the various nutrients required by the laying hen, and is a better feed than ever before. Coulson's balanced ration poultry foods are guaranteed to contain nothing but wholesome ingredients.

"THE RIGHT WAY," our booklet fully describes COULSON'S IMPROVED MASH EGG FOOD and other balanced rations for poultry and gives full particulars of guarantee and directions for feeding and care of poultry from the time they are hatched. If you have no copy of it, you should drop us a line today; a postal card will bring it to you.

We have agents selling our poultry foods in nearly every town in California. If you cannot obtain what you want from your dealer, write to us and we will tell you where to get it.

plumage, which they usually do better than it can be done for them.

Training.

Showing birds is a great game, and many various methods are used to get the birds to show. The best way is to raise them, of course, and I have known people to mate a pen five years in advance of a particular show, in order to raise a pen fit to exhibit there, and then fail. I have also known people to scout out among farmers and pick up a bird here, another there, at a little better than market prices, take them into the showroom and win out with them. Many buy a pen, ostensibly for breeding purposes, then berate the breeder for not sending prize winners, at breeders' prices. This hurts the business and the breed. If it is show birds you want, be honest and candid when ordering. You may have to pay more, but you will get your money's worth if you buy of a reputable person. You may not like the birds at first sight, and they may disappoint you greatly, but if you bought them to show, show them, and the judge will tell you whether the birds justified the price paid or not.

When I was breeding R. I. Reds, I used to cull out all light colored males and sell to farmers to cross on common stock very cheaply.

A lady bought a cockerel one year at 75 cents which I considered buff, not red. She came back next year and said the bird had improved so greatly, she thought I might exchange and give her a young one in place of it. I wanted to oblige her, so told her to fetch him over. He still looked buff to me, but our home show was short of birds, and wanted me to help out a little, so I sent him in with a string of other Reds, and he happened to be the highest scoring cock in the show, 95½ points, while the balance of my R. I. Reds scored from 92½ to 95½ one pullet being as high scoring as the male, so I sold that pair for a good price on the strength of their score cards, and their purchaser was delighted with them. Evenness of color in a R. I. Red is what counts, and he was one even shade from head to tail, while his undercolor was simply rich.

Undercolor.

Shall I be impertinent if I explain right here what the undercolor is? I did not know for some time when I first began to raise fancy chickens, and R. G. Buffinton, of Fall River, Mass., originator of Buff Rocks and Buff Wyandottes as well as Buff Ducks taught me, so I will pass it on. It is the color of the feather where it don't usually show, the fluffy part, from the skin out, and a Rock nowadays must be barred to the very skin. The undercolor plays an important part in most breeds, as well as what shows on the surface. My own Buckeyes have some slate in undercolor, because I believe when the slate is all bred out, succeeding generations fade into buff, but the R. I. Red Standard calls for clear red undercolor, free from slate, which is one of the points which separates the breeds.

In all the above I have not said one word about condition, but for the love of poultry, don't send a bird to a show that is not in the pink of condition, for sickness is often contracted by the healthiest birds, and the loss of a valuable show bird is something one never ceases to regret.

Our doctor's son at home always wanted chickens, but never attained

Chicks 10c and Up

Send today and get our price list on 19 varieties of thoroughbred chicks and eggs. Prices 10c and up. We can supply chicks in any number. Right now we are hatching several thousand per week. We ship them safely to all points on main lines in Cal., Nevada, and Ariz. Write us; we will be glad to quote prices. We are here to stay, and are the originators of the baby chick business in Southern California. Over 230,000 chicks ducks, geese, and turkeys have been sold by us so far this year. Largest baby chick dealers in the world.

his desire until he was married and settled in a home of his own. Then "Gene" bought a sitting of the best eggs he could get from a veteran Barred Rock breeder and raised a pen of beauties. He exhibted them, and won over the veteran himself. A prouder fellow I never saw, and his joy was the delight of all who knew him. Even his skeptical father enjoyed his victory, and the way he hung around that pen was a sight to see. Well, a couple of weeks after the show, his father stopped me on the street to tell me that "Gene's" cockerel had died. I tried to console him by telling him how many I had lost from show room colds, but he testily stopped me, saying, "You are an old soldier and are used to it, but this is poor 'Gene's' first birds." Verily, I thought, the Frenchman Rider Haggard tells about has lots of relatives. You know the Frenchman was dreadfully frightened when the boat shot into the side of the mountain, in the underground river, and in the darkness, amid the roaring waters of that dreadful cavern, he prayed his prayer. "O Lord save me, never mind the rest, let them drown, for they are used to it, but O! Dear Lord, do save me."

One word in parting and I am done. Don't bank too much on winning. Do the best you can, and await the outcome with patience, and remember this motto: "Blessed are they who expect nothing, for they shall not be disappointed."

Like Sparking.

Judge Chas. McClave, the genial and popular ex-President of the A. P. A. says: "Fitting birds for the showroom is like sprucing up to go sparking, and it is no worse to put a bird in the best condition possible than for a pretty girl to curl her hair when she expects a beau." But remember that missing feathers will count against a bird just the same as though they were present and off-colored, perhaps more, and where birds have broken their wing-flights fighting through fences, it detracts from their chances of winning.—Mrs. Metcalf.

Malthoid Roofing

Mr. H. B. Eakins, of the Commercial Warehouse Co., Los Angeles, Cal., U. S. A., writes: "Now that we have had two good rains to test our Malthoid roof, we have desire to express our satisfaction in the knowledge that we have a covering over our head that does not leak. We write you regarding our pleasure in this matter from the fact that we had fully expected more or less trouble, as we did not believe it possible that so large a roof surface could be covered with any material and stand the test of a first rain, but there was not a leak due to defective roofing."

The Paraffine Paint Co. San Francisco California

E. G. Judah, General Representative, Security Bldg, Los Angeles

POULTRY QUESTIONS.

Roup.

I have two game cockerels six months old, and a few weeks ago I noticed a running from their nostrlls. I have tried different remedies but have had no success whatever. Now they can hardly breathe, and I can hear them at a distance of fifty feet. They are lively and active and one looks as healthy as ever, but the other is getting pale around the eyes, and his comb is turning white.—V. D., Covina.

The cockerels have a roupy cold, and it may have run into bronchitis by this time. Wash their heads with warm soapsuds, then give each one half a teaspoonful of kerosene oil, and inject a few drops into each nostril. Also grease each one's back between the wings with camphorated lard as you would your chest if you had a cold on your own lungs. A chicken's lungs are just under the backbone and ribs, between the wings, and can be reached by medicine applied to this part. Almost magical results will sometimes follow an application of the camphorated lard, if well rubbed into the skin; have also used a few drops of kerosene with good results, but it is apt to blister. Examine the throat for canker and continue the half teaspoon doses of kerosene twice a day until it clears off.

If the birds cannot eat, dissolve four grains of bromide of potassium in some warm, sweet milk, and inject into the crop with a syringe every morning and evening until they are able to eat. As the rest of the flock may be affected, put about two grains of the bromide to each fowl into milk enough so all can get a dose, as a preventive.—Mrs. Frank Metcalf.

• • •

1—Would it do to use a fine bird in a breeding pen that has a crooked bill?

2—What is the cause of crooked bill?

3—Is there any way of ripening a white feather in a dark bird so it will drop out in the hope of a perfect one coming in its place?

4—Would there be such a severe cut on an imperfect bill that an extra fine bird would stand little chance of winning in the show room?

5—Is it best to swell alfalfa meal with boiling water or cold?—A Subscriber.

1—A bird with a crooked bill may do good work in the breeding yard.

2—Crooked bill is usually caused by some variation in heat while hatching or delayed incubation, but sometimes comes from in-bred stock.

3—Remove the white feather, and it may come in perfect, if a young bird, especially.

4—A deformed bill is a disqualification, and the bird would be thrown out, no matter how good in other sections, if the judge went by the rules of the American Poultry Association, as he should do.

5—Boiling water is best for the alfalfa meal, then cover closely to hold the steam. Many feed dry with good results.—Mrs. Frank Metcalf.

THE FUTURE OF THE CELERY INDUSTRY.

Continued from Page 464.

heavily after celery. They are a leguminous fruit, furnishing more or less nitrogen and requiring no irrigation; for these reasons a bean crop leaves the soil in excellent condition to produce another season. Harvest is usually over by October 1st, or just in time to begin plowing for beets. The land should be plowed deep during October and November, for beets, and allowed to lay open to the weather for a few months; you will then have little trouble in working the soil and getting a stand.

Beets are all harvested by November 1st, in ample time to grow a crop of clover, to plow it under before a celery crop the following summer. While we would not advocate growing beets successively, we do believe they make one of the best crops to plant before celery, as beets root deep, extract more or less alkali from the soil and dry the ground out, which is beneficial to this section. The deep plowing and thorough cultivation of the soil is also a great benefit.

All-the-year-round Income.

Now you have the three crops, celery, beans and beets. I would suggest that every farmer divide up his land so that he could plant about one-third each, to be rotated in the order mentioned. All three crops are good ones, and require different modes of farming, thereby giving the land a change. There is another good feature about this plan, the farmer would have a steady income nearly the year round. Beet returns would begin about August 15th and continue until the beans are sold in November, and as celery dividends begin December 15th and continue until April 15th you can see that there would be only three months in the year without an income.

Five thousand acres will be planted to grain and hay in the Beaumont section.

Irrigation and Forestry

GROWING THE EUCALYPTUS TREE FOR PROFIT.

Continued from Page 457.

Gunnii, E. Siberiana all stand very low temperature, and grow at an elevation of several thousand feet.

E. corynocalyx and E. polyanthema like warmth and moisture, but prefer well drained soils or uplands. The others mentioned grow well under ordinary conditions of soil and climate in this region.

Uses.

For wind-breaks—E. cornuta, E. globulus, E. leucoxylon, E. polyanthema, E. rudis, E. viminalis.

For shade—E. cornuta, E. rudis, E. robusta, E. polyanthema, E. globulus, E. corynocalyx.

For piles—E. globulus, E. rostrata.

For posts, etc.—E. rostrata, E. tereticornis, E. crebra, E. hemipholoia, E. pilularis, E. polyanthema, E. robusta,

Flower, Fruit and Leaf of E. Polyanthema.

E. rudis, E. Stuartiana, E. sideroxyloa.

For wagon work, etc.—E. corynocalyx, E. rostrata, E. cornuta, E. diversicolor, E. globulus, E. hemiphloia, E. tereticornis, E. leucoxylon.

For poles—E. pilularis, E. rostrata, E. tereticornis, E. corynocalyx.

For street paving—E. rostrata, E. diversicolor, E. pilularis.

The uses of these various eucalypts are almost endless, of which wagon work and agricultural implements generally seem to be most universal. Well seasoned lumber of E. rostrata and E. globulus has for years been used for furniture, cabinet making and interior finishing. It is becoming a staple just as fast as the material can be supplied in sufficient quantity. The price is from $100 to $150 per thousand. There is no more difficulty in seasoning the lumber than is experienced with other hardwoods.

The State Board of Forestry, the U. S. Department of Agriculture and the University Experiment Stations will furnish bulletins on the subject on application. But this will be done by expert lumbermen; all we have to do is plant and grow the trees.

Under ordinarily good cultivation in good soil these trees will average 1 to 2 feet a month for several years. In three years a diameter of seven inches has been reached, and from reports just in, this will soon be exceeded. In the warmer portions of the state, in deep soil, with good subirrigation, the growth is, naturally, greater than elsewhere. Poles, from 20 feet upwards, are produced in seven years, having a diameter of nine inches at base and seven inches at top. For smaller work, such as insulator pins, tool handles, wagon work, agricultural implements, etc., cuttings may be made much sooner.

The cost of preparing the ground, planting and properly cultivating and maintaining for two years should not exceed $40 per acre, and 1000 trees on an acre would not have to make the maximum growth to be worth 25 cents each for stakes at one year.

Leonard Coates.

Morganhill, Oct., 1908.

What's the use of a roof you have to keep tinkering?

Genasco Ready Roofing

puts an end to your roof troubles.

It is made of Trinidad Lake Asphalt, the natural waterproofer. It gives you absolute weather-protection years after ordinary roofing has "passed away." Guaranteed in writing, and backed by a thirty-two-million-dollar organization.

Australian Eucalyptus Seed

Our Mr. R. S. Webb (a native Australian) has just returned from that country with seventeen varieties of Eucalyptus seed, comprising the varieties that have been tried in Australia, and each variety is the best for the particular purpose for which it is used, or for the particular soil and climatic conditions where they grow.

The following are some of the varieties of Eucalyptus trees preferred by the lumbermen and manufacturers of Australia:

1. Iron Bark (Panniculata)
2. Microcorys (Tallow Wood)
3. Black Butt (Pilularis)
4. Turpentine (Syncarpis)
5. Resinefera (Mahogany)
6. Tereticornis (Red Gum)
7. Saligna (Blue Gum)
8. Corynocalyx (Sugar Gum)
10. Spotted Gum (Maculata)
11. Jarrah (Marginata)
12. Sideroxylon (Iron Bark)

We will have trees of the above varieties for sale about February 1st.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

The Eucalyptus.

D. F. Savage, of Hopkinsville, Ky., asks about the Eucalypts. It is not safe to speak of trees in an untried locality. The Eucalypts are a decided success here. Our climate and conditions are much the same as those of Australia where we got these trees. Here they are very beautiful, grow with astonishing rapidity, and are very valuable for honey and all uses to which timber is put. They grow with very little water, and here need no attention after they are once started. They will not endure very great cold. The varieties that we like here very much are Eucalyptus globulus, blue gum, E. rostrata, red gum, E. rudis, which with the red gum stands cold well, E. viminalis, manna gum, E. corynocalyx, sugar-gum,and E. terticornis, forest-gray gum. Two species, E. ficifolia and E. sideroxylon have very handsome, showy blossoms, while E. citriodora is sweet scented but tender of cold. Unless it is known that these will stand the climate of Kentucky or any other locality, they should be planted very sparingly and as an experiment at first.—Prof. A. J. Cook.

The eucalyptus will not stand Kentucky conditions. Fifteen degrees is the extreme limit on Rudis, Rostrata and Tereticornis, the most hardy, and Kentucky sees weather a whole lot colder than 15 degrees.—Ed.

Pumpkins to Cows.

Kindly give me your opinion regarding the effects of feeding squashes with the seeds in them to milk cows. Do the seeds either dry cows or reduce their flesh? Are they injurious also to laying hens?—O. U. P.

The seeds of pumpkins are sometimes given as a diuretic but the effect is slight. We chop up the pumpkins for the cows and pigs and pay no attention to the seeds. The chickens receive some but as we keep no accounts with the chicken yard, I can not answer the last part of this question.—M. E. S.

The question as to effect on poultry will be answered by Mrs. Metcalf later.

Fever.

My Jersey cow seven years old has always been well until she calved in May when she had milk fever but recovered rapidly after being treated with the air treatment. About two months ago she failed in her appetite, also milk for several days but seemed to get all right again.

Oct. 19 she again refused to eat, her milk immediately ceased to flow, to any extent, the left back quarter of her udder began swelling and has gotten in bad condition but it doesn't seem very tender.—J. M. H., Upland.

These attacks of fever may come from several different causes. I should blanket this cow at night and shelter her from winds in day time. Try giving her some of the prepared stock foods, or give her chopped pumpkin and green grass. If she will take it rolled oats and bran half and half are excellent to bring her up. Anti-Phlogiston is a fine application for the cow's udder when the congestion has been of long standing.— M. E. S.

Apples—Eucalyptus.

I have taken up a claim of government land in the northeast corner of San Bernardino county, joining the Nevada line in Parumpt valley. The soil is recommended for apples. What varieties are best, sell best and would do best in that section? How about pears? Temperature varies from 15 to 115 degrees. What varieties of eucalyptus would be best? Would the pepper tree flourish there as here? What ornamental trees, shrubs and vines would you recommend and when should they be started? Would it be too cold for the palm?—C. M. H., Whittier.

The soil may be right for apples, but it is doubtful if the climate is right for winter apples. We judge from your description that the climate is similar to that of the Imperial Valley. No doubt red and white Astrachan and Duchess de Oldenburg will be profitable as they are early summer varieties and come in when apples command a good price. Do not try more of fall or winter varieties than will suffice as an experiment. You may get a late or second crop that will be of good quality, but you can't count on it.

Bartlett pears should do well with you and the climate may help them to be blight proof.

Plant Eucalyptus Rostrata, Tereticornis and Rudis.

Pepper trees will no doubt be killed when young by 15 deg. temperature.

We have found that in the Imperial Valley, oleanders and altheas are very vigorous and make a splendid show. Many varieties of roses do well and are remarkably free from mildew.

The cannas that have blooms of firm and rather stiff texture do exceedingly well but the fine varieties with delicate blooms soon wither, in fact fail entirely to mature blooms. Madam Crozy and Alphone Bourier are yellow and bright red varieties that are suited to the climate. Petunias, geranuims, phlox and cosmos do well. The latter will grow well in the spring but when hot weather comes will check in growth and make some bloom for several weeks, when it will shut up and make its usual growth and bloom in the fall.

The fig makes a good yard tree as does also umbrella and Arizona ash. The pepper tree does well in the Imperial valley but blows over after irrigations, in soft soils.

We have given these notes relating to the Imperial Valley, because they relate actual experiences there and the similarity in climate between these and your section may render them useful to you.—J. W. M.

Eucalyptus in Arizona.

We have an altitude of 3490 feet. Sometimes we have hard frosts in winter and the summers are very warm. Our rainy season is in July. We have some Eucalyptus corynocalyx one year old which were raised from seed. Two nights ago the frost killed the leaves. Will these trees die? And will Rostrata or red gum stand the frost better? What shade tree would you recommend for this climate? What is the proper time to plant castor beans?—Subscriber, Douglas.

We fear your corynocalyx are all dead. If not, they doubtless will not be able to stand the winter. It is one of the most tender of the eucalyptus family. Rostrata, Rudis and Tereticornis are more hardy but we question whether any of the eucalyptus family now tested will stand your climate. You do not say how low the temper-

The Altland Fruit Company at McPherson, Orange county, made the first shipment of oranges from Southern California this season.

ature goes but if it falls for any length of time to fifteen degrees, trees other than the eucalyptus will probably give you better service. We imagine the umbrella tree would be desirable. Chestnuts are excellent and a beautiful shade tree. If you have sufficient water it is probable the elms or maples of the east would grow satisfactorily to you. In your climate we imagine the castor bean should be planted in the spring time, February or March.

Peach Tree Borer.

I have peach trees affected with borers. What is the remedy and how can their attacks be prevented? What is the name of the insect?—Subscriber.

I suppose you refer to the root borer. They should be dug out of the borings. Very often a small wire can be run down into the channels which will kill them if the wire reaches them.

Remove the earth to a depth of six inches around the base of the tree and fill into the surface with air slaked lime. Pure sand will prevent their attacks to a certain extent as the insect restricts its work almost entirely to heavy land. In addition to the lime preventive, wrapping the trunks with paper or sacks or whitewashing them is an advantage.

Sannina Pacifica is the name of the borer.

Keeping Seed from Weevil.

How can I keep cow pea seed from the weevil until ready to plant.—T. Kiyono, League City, Texas.

Place in an air tight bin or box; then in a dish or on absorbent cotton place bisulphide of carbon, so that its fumes will penetrate all of the interior of the box. Use this at the rate of 1 pound of bisulphide to every 100 bushels of the beans or grain. Close tightly and leave a few hours or over night. Then store where the insects may not get at the grain. Be carful not to keep fire or lighted cigar near the gas of the bisulphide as it is explosive.

Spineless Cactus.

Is anyone in a position to state from actual experience the good and bad features of spineless cactus?—B. J., Anderson.

We do not think there is any one with experience which would be of value to you on the cactus question. We doubt not it will be several years before very valuable information may be had on that subject. We know that recently a car load of the young plants was shipped from Santa Rosa to be replanted in the San Joaquin valley. In time these will make a showing of their worth or otherwise. If any subscriber of the Cultivator has any information to be given along this line it will be appreciated by many who are interested.

May Beetle Grubs.

I send grubs from manure pile. They eat the roots of my blue grass lawn so that I have had to dig my lawn up. I cannot find a description of them in my book of "Injurious Insects." I wish to ask for a description of them and of their life habits. I put cow manure on my lawn two years ago and I think they got in my lawn at that time.—B., Pasadena.

They were decided to be the grub or larvae of May beetles, but to be sure to have the latest information regarding them, the query was referred to Prof. H. J. Quayle, entomologist at the Pathological Laboratory at Whittier. And he replies as follows: "You are correct in judging that these are the larvae of the May beetle and are commonly known as white grubs. As for remedy, I know of nothing that is quite satisfactory. Tho liberal application of kainit or of nitrate of soda is said to be fairly satisfactory, but I cannot vouch for this from my own personal experience. In case they are abundant enough in the lawn so as to destroy much of the grass, plowing or spading up and leaving in this condition without water for a few weeks is a firstrate method here in California. Chickens and turkeys also destroy great numbers of these if they can be at hand when the plowing or digging is done. These larvae cannot withstand any drying of the soil, and hence during the dry season a couple or three weeks will be sufficient to kill those that are left in the soil. The lawn may then be re-seeded and further trouble from this insect avoided."

The May beetles sometimes called June bugs, belong to the genus Lachnosterna and during May and July are flying about, and when a lamp is on the porch or in the open the big mahogany brown bettles are blundering around into everything. The beetles are sometimes plentiful enough to do great injury by eating leaves of trees.

Fall Plowing.

Woud you advise fall plowing between fruit trees for mulching purposes?—O. A. D., Phoenix.

We hardly know what our inquirer wishes to know in asking his question. But we believe the best treatment of orchards at this time of the year is to irrigate the ground heavily; drill in a good crop of Canadian field peas or of vetch seed. Leave the ground in condition so it may be irrigated in case of light rains. Then plow under in February or March. This adds some needed elements to the soil and at the same time puts it in a much better mechanical condition.

Legal Queries

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Agent's Commission.

Can a land agent collect fees when the customer refuses to buy at the time, but eventually turns up after a few months and buys it, especially if out of agent's hands when bought?—E. J., Fresno.

1st: An agent cannot collect fees under the ordinary agent's agreement unless he produces a customer, within the time limited in the contract, ready, willing and able to buy.

2nd: If the agent can establish bad faith or fraud on the part of the owner, he would be entitled to recover his commissions, although the purchase was made after the time limited in the contract, or an extension thereof by the owner.

The foregoing answer is based upon the presumption that the agent's commission was to be paid by the owner, as such is the customary transaction, and the answer might be different if all of the circumstances, which gave rise to the question, were known, as there are seldom two cases alike.—Edw. L. Payne.

MACHINERY WANTED.

WANTED—TWO PUMPING PLANTS IN good condition, 8 to 20 H. P. Address BOX 297, Corona, Cal.

HOGS.

REGISERED BERKSHIRE AND POLAND China hogs, both sexes. C. A. STOWE, Stockton, Calif.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

GRANDFATHER AND THE NEWS.

Grandpa was reading his paper,
Grandmother knitting by,
The gentle purr of the kettle
Stirred the silence pleasantly.
"Found any news yet, Father?"
Softly Grandmother said.
At that moment, excited, he found it
"Abe Sawyer is shingling his shed."

Knitting-work was forgotten;
Grandmother's face was aglow.
"Land, you don't tell me, Father!
"Abe Sawyer! I want to know!"
Grandfather's tremulous finger
Pointed, "Right there!" he said,
Both old heads bent above it,
"Abe Sawyer is shingling his shed."

Tumults of man and of nature,
Crashing of nations at war,
Weighty political issues,
Perils in wait at our door—
Grandfather passes them over
Hunting for *news*, instead,
Yes, sir, right here we have it!
"Abe Sawyer's shingling his shed."

Talk about fraud and corruption!
Tell us that newspapers lie!
Grandfather's faith is implicit,
Grandmother smiles trustingly.
This age is an age of progress,
The Golden Age, when all's said.
We're marching upward, I tell you,
"Abe Sawyer is shingling his shed."

BENNIE'S BLUFF.

"HOW many times do you want me to say it?" demanded Miss Callonby. "I thought we had that all settled finally and forever."

"I didn't understand it was 'finally,'" said Bennie Purvis. "I hoped—"

"I told you there was no use hoping," snapped the young woman. "You asked me if you mightn't hope and I distinctly told you no. That's what I said, and now you drag the whole thing up again."

"Was that the last time?" asked Bennie, doubtfully.

"You know perfectly well it was. It was in this very room. I'll have witnesses the next time, or a phonograph."

"There isn't going to be any next time." Bennie said this quite determinedly.

"You said something to that effect before. There oughtn't to have been any this time. There wouldn't have been if you had any regard for my feelings."

"Oh, I say!" remonstrated Bennie, in his best English manner.

"Well, you haven't. You know it's a painful thing for me to have to refuse you."

"Why do you do it, then?" asked the young man, not unnaturally. "Why not have some consideration for my feelings and say 'Yes?'"

"Because I don't want you. I'm not going to marry you just to spare your feelings."

"I haven't any idea of asking you to marry me to spare my feelings. If you were willing to do it I shouldn't let you."

Miss Callonby pouted. "I don't see how you could help it," she said. "But you needn't feel alarmed. I'm not going to. You're the last man on the face of the earth that I would dream of marrying. My refusal—I should like you to understand that it is positive. I want this to be the very last time. I shall be angry with you, Bennie, if you ever approach the subject again."

"I shan't. Don't worry about that."

"I wish I could believe you."

"You may believe me, all right. I can promise you safely that you won't be pestered any more so far as I'm concerned."

"Bennie," said Miss Callonby, "you aren't angry with me, are you?"

"No." answered Bennie.

"Truly?"

"Truly."

"Because, you know. I would if I could possibly., I wouldn't have you really angry with me for anything in the world. You know that, don't you? What makes you say I can believe you in that way?"

"Because I mean it."

The young woman looked at him long and seriously. "Bennie, you don't seem natural at all this evening," she said. "There's something hard about you that I don't like. I believe you are angry with me, and you never were before in your whole life."

"And I never will be. I shall always have the very kindest thoughts of you."

"I don't want 'the very kindest thoughts.' You talk as if you were going to China and didn't ever intend to come back."

Bennie smiled sadly. "That is a mighty near guess," he said. "The Philippines."

Miss Callonby gasped a little "You're joking." she said.

"Never a joke," declared Bennie. "I've a good chance at a good thing out there, and I made up my mind that if you said 'No' tonight I'd take it. And when I really do make up my mind—"

"Change it," said Miss Callonby. "Change it to please me. I don't want you to go to that wretched place. You'll have fever and all sorts of horrible things."

Bennie shook his head. "I guess I might as well say good-by now," he said.

He held out his hand. Miss Callonby took it and stood with her forehead wrinkled thoughtfully.

"I'll miss you horribly," she said at last.

"Just a little at first," said Bennie.

"No, all the time. You won't change your mind?"

"No."

The thoughtful frown on the young woman's face deepened as the clock ticked on.

"Good-by," said Bennie.

She raised her eyes to his and found them sad but inflexible in expression.

"Bennie," she said, hesitatingly, "if I asked you to ask me again—what you asked me before, would you? You promised me not to but would you? Wait a moment. I said 'No' this evening and you said if I said 'No' you'd go to the Philippines, and you wouldn't change your mind. Would it make any difference if I said 'yes?'"

"Are you asking out of curiosity?" demanded Bennie, sternly. But he saw that she was not.

"It was a blamed mean trick," Bennie said to himself as he left the house. "Still, I'm mighty sorry I didn't think of it before. If she ever finds out I was bluffing—." [Chicago Daily News.

THE WRONG BOY.

Mother (viciously scrubbing her small boy's face with soap and water) —"Johnny, didn't I tell you never to blacken your face with burnt cork again? Here I have been scrubing half an hour and it won't come off."

Boy (between gulps)—"I—uch!—ain't your little boy—uch! I'se Mose, de colored lady's boy."—Judge.

HOMELY HINTS.

Pieces of soap should be saved and not left to waste by the kitchen sink. Put them in a jar and when there are several pieces shred them and put into a saucepan, allowing a teacup of soap to a quart of water. Add a dessert-spoonful of borax and boil until dissolved. Pour into jam pots and keep the jelly for washing flannels and light things. The soap jelly is easily dissolved in hot water and in a lather made in this way the finest woolen goods can be washed.

Old wooden floors are improved this way: Dissolve one pound of glue in two gallons of water. Stir into this enough fine sawdust to make a thick paste and fill the cracks with it. The paste may be colored to match the wood. Or you can try this: Fill the cracks with putty. One can make the putty by mixing whiting and linseed oil together and kneading it until the paste is smooth. The putty may also be colored to match the wood.

Disease often lurks in the sink or the bath-tub pipes. Hot water and lye, carbolic acid or ammonia, will keep them clean.

Muriatic acid will remove dark stains on the porcelain sink or bath-tub.

Washing Table Linen.

Table linen should be washed alone and should not be put in the tub with bed or body linen. The linen should first be examined for stains and as there are always tea, coffee and fruit stains apt to be on the linen these should be removed by boiling water. It will not require much rubbing after the stains have been removed. The clothes wringer should be screwed loosely, for the material in table linen is soft and easily creased. If the linen is worn so that using it once renders it creased and soiled, it may be put in a little thin starch.

Piece bags, which are decidedly convenient and which save time and bother in the sewing room, are made so that one glance at the bag discloses what its contents are. For white scraps and pieces make a bag of white cotton or muslin. Also make a bag of outing flannel for the woolen scraps. Colored wash goods should be kept in a gingham bag, and a bag of silk will contain the silk pieces. If this plan is adopted the different kinds of scraps will be kept separate and one will know which bag to go to by a glance at it without having to rummage in each one before the article wanted is found.

CARE OF THE PANTRY.

If there is any room in the house where order and cleanliness should reign supreme it is the pantry. Here it is that most all our foods are kept, and so many articles of food become unfit for use when exposed to foul odors or those from other articles of food equally as pure. For example, the odor of onions will ruin milk or flour, as will also the odor of coal oil. Salt is a disinfectant and very susceptible to foul odors. Thus it is seen that one cannot be too careful. All pantries in modern homes are arranged with closed shelving. This saves much of the labor generally required to keep the pantry clean. But many pantries have open shelving extending from the floor to the ceiling. And what woman is there who does not know the constant effort it takes to keep it clean? The top shelves just seem to fill up of their own accord, but never arrange themselves in order. One must climb up and down dozens of times for one cleaning. The best thing to do is to place only such articles upon the high shelves as may be inclosed in tin cans and boxes or earthenware, and let these be articles not often needed. Have all the shelving painted some light shade and do not use paper or oilcloth upon them. The floor should be covered with linoleum, unless the cracks have been filled and the floor painted. Have bins made below the shelving to contain flour, meal, sugar and potatoes, (if potatoes must be kept in the pantry.) These bins should either be hinged to the floor or the revolving sort, so they will not require lifting and will always be closely covered when in position. The closed closet for containing the cooking utensils is indispensable. It should contain shelves for pans and hooks for hanging up skillets and articles containing rings for hanging them up.

BREAKING IT GENTLY.

"George," said she, "you have held a good many high positions at one time and another."

"Yes," said George, who had been married long enough to know that non-committalism is the best home policy.

"And I have heard it said that your success was due to the magnetism that drew men toward you."

"Um—I—"

"Don't pretend to be bashful, now. And I was just wondering if you were magnetic enough to draw the tacks from the drawing-room carpet tomorrow morning before breakfast."—Tid-Bits.

NOT WIDOW ALONE.

Tomdix—In speaking of Mrs. Weeds why do you persist in calling her a "widow woman?" Why not say "widow" alone?

Hojax—But Mrs. Weeds is quite good-looking—and a good looking widow is seldom alone.—Chicago News.

THE LIMIT.

Mrs. A.—I understand your husband is fond of an argument.

Mrs. Z.—Yes, indeed! Why he even refuses to eat anything that agrees with him.—Pick-Me-Up.

Mayer HONORBILT

SHOES FOR MEN

These splendid men's shoes represent the best there is in shoe leather. Every piece of material is of the choicest tannage. The workmanship is perfect; the styles are up-to-date. When it comes to service, there is nothing that equals them in lasting qualities.

"HONORBILT" SHOES

are everything the name implies. They are *"built on honor."* No matter where you look, or what you pay, you will never find anything that will outclass them in wear, style or comfort.

If your dealer will not supply you, write to us. Look for the *Mayer Trade Mark* on the sole.

FREE—Send us the name of a dealer who *does not* handle Mayer Honorbilt Shoes, and we will send you free, postpaid, a beautiful picture of George Washington, size 15x20.

We also make Leading Lady Shoes, Martha Washington Comfort Shoes, Yerma Cushion Shoes and Special Merit School Shoes.

Light and Cook
BY
COLT TRADE MARK Acetylene Gas

See the issue of this paper, October 15, page 381, also of October 29, page 429, containing illustrations of gas lighting apparatus for homes. You may install brackets and chandeliers, plain or ornamental, and be equipped with artificial light by "turning on the gas," in the same convenient manner as in city homes.

Colt Acetylene gas, made on the premises by an individual generator, simple of construction, and easy of operation, more resembles sunlight than any other known artificial illuminant. The light is clean, cool, clear, always of the same brilliancy.

The cost is less than the same amount of kerosene light, less than city rates for gas or electricity.

The Generator is here exhibited from which acetylene gas is distributed through pipes to the various parts of a dwelling. It is an article capable of being understood by a boy of average sense. After the machine is set in place, it needs no attention, except about once a month, depending on the consumption of gas, to fill a hopper with carbide, the substance from which acetylene gas is made.

Mailed request for particulars will be answered by a catalogue explaining the superiority of this method over kerosene lamp-light, over frequent refilling, cleaning and breaking.

Firsts....24@25
Storage short time....36@39

Poultry begins to feel the impetus of approaching Thanksgiving. It is predicted the turkeys will be exceptionally high. But little storage stock is in hand and imports are promised to be light. Besides a much heavier demand than last year is anticipated, and will surely be realized unless the present "returning prosperity" talk proves to be untrue. We do not think it will.

Hay.

Somers & Co., say:

Arrivals of hay during the past week have been ranging about as they did the week preceding, the total showing but 2210 tons. Although prices were well maintained, yet there was no particular undercurrent of strength to the situation due very largely to the impending election, which although it has caused no undue excitement, yet has been of peculiar interest to the hay and grain trade, for most of the operators concede that the market is in a peculiarly sensitive condition to be in all likelihood materially advanced under renewed business activity providing the safe candidate be selected.

The account of stock which has been recently compiled by the San Francisco Hay Association shows but about one-half of last year's quantity of the available supply of hay in public warehouses throughout the country contributary to San Francisco. We are promised some relief from outside states and as it is generally understood that the consumption is materially less this year, it may be that we will get through the remainder of the season without material trouble. The tendency of the market from now on should most certainly be towards a higher range of prices and any unusual demand will probably bring about a marked advance.

Citrus Market

LOS ANGELES, Nov. 11, 1908.

Oranges are going forward slowly in fact practically none from south of Tehachapi. The California Fruit Exchange is shipping none whatever. The Exchange is shipping from Tulare and Butte counties. All told from those two sections 400 cars have already been forwarded.

The earlier navels sold up to $2.00 or a little better f. o. b. California points. The later ones a trifle lower.

There has been some complaint of green, sour oranges. It is possible the season is being crowded a little too early. Loss will surely occur later if such is the case.

Southern California shipments aggregate about 100 cars.

The following quotations on Valencias are of those shipped some time ago.

NEW YORK, Nov. 9.—Six cars Valencias and seven cars lemons sold. Market is very steady on high colored fruit, but somewhat lower on off colored, coarse stock. Lemon market opened weak and lower but gradually advanced with the close of the market firm. Weather warm, favorable.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

Injured Eye.

I have a mare that got down and in struggling to get up bruised one eye. It is now about three weeks since it was injured. It has turned white and runs water; the sight is destroyed. Also have mule colt six months old that has a small navel rupture about the size of a small hen egg. The opening is about the size of a dime. The rupture is easily pushed back but comes down as soon as let loose. I first noticed it when the colt was about three months old. Please give remedies through the Cultivator.—Subscriber, Paso Robles.

The sight may be destroyed at present, but the eye will probably clear up in a few months, unless the eyeball is destroyed. Get the following prescription filled and use it in the eye five or six times daily. Inject a few drops at a time with a curved medicine dropper: R—Adrenolin (1 to 1000 solution,) one dram; distilled water, seven drams. Mix and use as directed.

As to the rupture it will take a surgical operation to cure it, which I would advise you not to try yourself. You might try fastening a hard pad over it and if you can contrive to keep it in place it may cure it.—R. T. V.

Possibly Lumpy Jaw.

I have a young cow, about to have her third calf next May. A large lump came under the left side of her jaw bone. It commenced to come about three weeks ago. I cut it the other morning and a lot of discharge came out. I bathe it with hot soda water but it still keeps sore. She eats well but has got a little thin. Do you think it advisable to use her milk? What do you think is the matter with her? She wears a halter all the time. I would be much obliged for your information.—J. J. J.

There will be no harm from using her milk. It is impossible to say what the nature of the sore is without an examination. It may be a simple abscess, in which case all it needs is opening, cleaning out and treating as any other open wound.

Or it may be actinomycosis (lumpy jaw,) in which case the cow should have internal treatment with potassium idodide, one-half ounce daily for thirty to forty days.

Would advise you to cut out a small piece from the lump, place it in a solution of formaline and water, twenty drops to one ounce, send it to University of California veterinary department, Berkeley, and ask them to let you know whether it is actinomycosis or not.—R. T. W.

ELECTRIC POWER ON THE FARM.

Electric railways radiate from the larger cities and link towns and villages together into one large chain. The farmer realizes the advantage of such a system as a means of transportation, but so far he has overlooked the greatest advantage of all—that of obtaining power to operate electric motors.

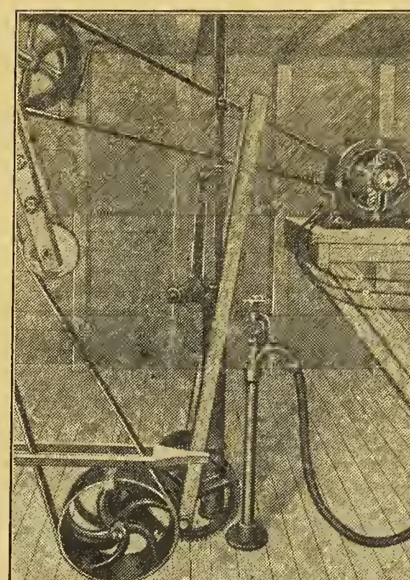
The electric railway company is willing to supply the power at a nominal sum, the manufacturer stands ready to furnish a reliable motor and it remains for the farmer but to express a little interest and all the advantages of modern electricity will be at his command. As the electric railways operate at 500 volts direct current, the power can be wired direct to the motor without the use of any of the auxiliary apparatus necessary on a high tension alternating current system and a motor once installed needs practically no attention.

Success in farming depends in a large measure upon the manner in which the odd jobs are done. The average farmer finds it difficult to obtain a steady, reliable man. But the work must be done, so he does it himself, meanwhile neglecting his other and more important duties. His more progressive neighbor will install a small electric motor.

Few people realize the varied uses to which an electric motor can be put on the farm or dairy. A few of the many machines now being driven by electric motors are: churns, cream separators, ensilage cutters, corn shredders and shellers, grist mills, feed grinders, saws, grindstones, ice cream freezers and all kinds of pumps.

Every farmer needs water badly and no investment pays as sure returns as a permanent, reliable water supply for the house, dairy, barn, lawn and fire protection. A farmer does not realize at what a small cost he could have a running water supply in the house. A windmill to pump the water is a very economical arrangement, but the lack of wind is felt particularly in the hot summer months.

Mr. A. L. Feighner, a farmer residing near Marion, Indiana, has



solved this problem of an adequate water supply at a low cost. He had erected orginally on his farm a wind mill operating a pump. This gave him a good, but very unreliable water supply, because just when he most needed water there was no wind to operate the pump. To this equipment he added a pumping jack and a small Western Electric Co. direct-current motor. His present equipment, as shown in the illustration, makes it possible for him to have an unlimited supply of fresh water at a low cost. The pumping jack can be readily adjusted to any pump and disconnected by simply removing a single bolt. The motor is not used, of course, when there is sufficient wind to operate the pump, which tends to save power. The power necessary to run the motor is supplied at a very low cost by an inter-urban railroad which crosses the farm. Mr. Feighner is so well pleased with his outfit that he contemplates operating some additional apparatus from the line shaft in the near future.

An electric motor of standard manufacture once properly installed can be relied upon for instant service at any time. It can be operated just as cheaply as a gas engine and much cheaper than the steam engine. Besides, gasoline and oil are dangerous to handle. A few farmers can perhaps adjust the loose packing of a steam engine or start a cranky gas engine when it gets out of order and refuses to start. But can the ordinary man? Surely his wife cannot be expected to turn the heavy fly wheel of a gas engine or fire a boiler. Any one can start an electric motor by simply throwing a switch.

The electric motor is a cheap, clean and reliable source of power, available at all times and so simple that even a child can operate it.

President's Thanksgiving Proclamation

ONCE again the season is at hand, when, according to the ancient custom of our people, it becomes the duty of the President to appoint a day of prayer and of thanksgiving to God. Year by year this Nation grows in strength and worldly power. During the century and a quarter that has elapsed since our entry into the circle of independent people we have grown and prospered in material things to a degree never known before and not now known in any other country. The thirteen colonies which struggled along the seacoast of the Atlantic were hemmed in, but a few miles west of tidewater, by the Indian haunted wilderness, have been transformed into the mightest republic which the world has ever seen. Its domains stretch across the continent from one to the other of the two greatest oceans and it exercises dominion alike in the arctic and tropic realms. The growth in wealth, in population has surpassed even the growth in territory. Nowhere else in the world is the average of individual comfort and material well-being as high as in our fortunate land.

For the very reason that in material well-being we have thus abounded, we owe it to the Almighty to show equal progress in moral and spiritual things. With a nation, as with individuals who make up a nation, material well-being is an indispensable foundation. But the foundation avails nothing itself. That life is wasted, and worse than wasted, which is spent in piling, heap on heap, those things which minister merely to the pleasure of the body and to the power that rests only on wealth. Upon material well-being as a foundation must be raised the structure of the lofty life of spirit, if this Nation is properly to fulfill its great mission and to accomplish all that we so ardently hope and desire. The things of the body are good; the things of the intellect better; but best of all are the things of the soul; for in the nation, as in the individual, in the long run it is character that counts. Let us, therefore, as a people, set our faces resolutely against evil, and with broad charity, with kindliness and good will toward all men, but with unflinching determination to smite down wrong, strive with all the strength that is given us for righteousness in public and private life.

Now, therefore, I, Theodore Roosevelt, President of the United States, do set apart Thursday, the 26th of November next, as a day of general thanksgiving and prayer, and on that day I recommend the people shall cease from their daily work, and in their homes or in their churches meet devoutly to thank the Almighty for the many and great blessings they have received in the past, and pray that they may be given strength so to order their lives as to deserve a continuation of these blessings in the future.

In witness whereof I have hereunto set my hand and caused the seal of the United States to be affixed.

Done at the City of Washington, this thirty-first day of October, in the year of our Lord one thousand, nine hundred and eight, and of the Independence of the United States, the one hundred and thirty-third.

—Theodore Roosevelt.

CALIFORNIA CULTIVATOR CLUBBING PRICE LIST

Good Until October 1, 1909

Periodicals in any club offer will be sent to the same or different addresses, except foreign and Canadian, where there are always extra postage charges. Foundations for Good Public Highways

Part of an Address Delivered Before the Recent State Farmers' Institute

By J. M. EDDY, Secretary of the California Good Roads Association

IN the United States we have three services that may be classed in a general way as types of public ownership of public utilities, namely, the postal system, the free public schools, and the public highways. From the foundation of the government these utilities have been owned and managed by the people through the instrumentality of federal, state or municipal law. What has been the policy toward each, what the system of management, what the quality of service, and what the general verdict at home and abroad as to their success or failure under public ownership?

The postal system was founded by Benjamin Franklin and the Federal Constitution reserved to Congress entire control over its management. It started with, and has continued under, a centralized system directed by a responsible head. The result has been a universal verdict among intelligent men that it is the best postal service as a whole ever established anywhere in this world.

View of "Object Lesson" Road near Stockton, This Road was Constructed by the Stockton Chamber of Commerce Under Auspices of Government Experts. Photo Taken October, 1908.

The free public schools had quite a different growth and are administered under different auspices. The federal government has no direct voice in their management, but it has contributed most liberally for their support and to their encouragement. The free school system of the United States, though varying in details in the different states, is conceded to be the most satisfactory and successful known in the world. So it is apparent that efficiency and success of a public utility do not depend wholly on Federal control and management. Here we have a wonderful institution reaching into every locality, benefiting every family, in the support of which the nation, the state, the county and the city co-operate, but for which the state law provides the system of organization while local authorities actually administer the service.

It would not be an extravagant statement to say, that if the 20,000,000 acres of land which are embraced in roads in this country were devoted to agricultural purposes, the market value of the area would be $1,000,000,000 and it would sustain in prosperity six million inhabitants.

No Care of Great Investment.

What system has been devised for the improvement, care, utilization and maintenance of this highway plant into which the people have put a billion dollars' worth of land as an investment? Have we a centralized administration under a responsible head, as is the case with the postoffice department? Have we a civil service system, as they have in both the postal and school systems? Have we a trained force of employees, holding special license, as do school teachers? Do we have either Federal control or Federal appropriations? Do we have freedom from politics, specialized highway engineers, expert road builders, competent, experienced and continuous administration? Do we have a strict system of accounting, so that the public is informed just where every dollar goes and why it goes there?

No. We have no uniform system, no organized administration; no trained force of roadmakers, no protecting wall to keep out politicians, no adequate system of accounting, no public conception of the fact that in an age of specialization, so intricate a problem as the improvement and up-keep of a plant which has cost us a billion dollars, which is used every day century in and century out, which has more to do with the prosperity and the comfort of all the people than any other factor except weather, and on which we expend annually $80,000,000 just to keep it running—that this great public interest is left the prey to chance, to incompetency, to abuse, and often to graft.

Three Factors.

The public highway system of the United States has been a complete failure, not because of public ownership, but because it has never been systematized, organized, administered, specialized, properly accounted for and made uniform.

Transportation on the public highways to be efficient and economical, must have three elemental factors favorable, namely, application of proper power, an easily worked vehicle adjusted to the land and the road, and a smooth and uniform roadway. With our improved vehicles and superior roadsters, the American producer should be enabled to move the 250,000,000 tons of agricultural products to the shipping points at a less figure than it could be done in Europe. But owing to the wretched condition of rural roadways it costs us annually $125,000,000 more to move our farm crops to the shipping points than it would cost in France, England or Germany, to move the same number of tons the same distance. To save that annual burden of extra cost would warrant us in expending two billion and a half dollars in road improvements.

Not Good Enough for Us.

This is an age of speed, comfort, convenience. While railroads and electricity have been developed, while steamships have displaced sailing vessels, while typewriters have done away with handwriting, and linotypes with printers, the public roads of America are just what they were a century ago, and all attempts to improve them are met by the assertion that if they were good enough for the pioneers, they are good enough for us.

The $80,000,000 expended annually for road construction and maintenance is, of course, not entirely wasted, as large sums are really required to put the roads in usable condition for certain seasons, but a large proportion of the $80,000,000 is needlessly expended because we do not expend more and perform our work better. This is only seemingly a paradox. The expenditure of large sums to make and maintain better roads would effect a reduction in the cost of transporting farm products and this economy, if continued, would eventually save enough to improve all the roads.

National Aid.

It is probably out of the question for us at this late day to put the highways of the country under national control and management, but there is no reason why the national government should not make substantial contributions for the maintenance of good roadways in all the states of the Union. Neither the Federal nor state government, in aiding the public schools, goes into the district to build a schoolhouse and equip it for the accommodation of teachers and pupils, but rather they leave to local communities the task of putting in the plant and then they supply a portion of the funds which helps maintain, under proper restrictions, an efficient school system. In short, they contribute largely towards the maintenance of schools and make it compulsory on the local community to provide the schoolhouse and equip it with proper school facilities.

I feel that the real interest of both state and national authority should be in providing a fund for the maintenance of suitable roadways after the local communities have seen fit to construct them in a proper manner after methods, rules and supervision provided by the state or the nation. I think such a policy would solve, in large measure, our public highway problem and if we could remove something of the complexity of our highway laws and resolve it to a simple system of state and national aid with local constitution under state supervision, the whole problem of good roads would be satisfactorily solved, at least for the next succeeding generation. Our people are jealous of their local convictions and while it is necessary to remove the supervision from local influence, that supervision can be better effected through a penalty of loss of state and national aid than by coercive measures under the general laws.

Applying Oil to Secure Dustless Surface on Macadam Road near Stockton, Taken October, 1908.

Continued on Page 496.

Save Time--Save Fruit

With the Brewster Picking Sack

A new method sack—invented and perfected by lifelong growers. Eminent orchardists pronounce it perfect. Those who have tried it say they would not be without it. Actual tests show that a man can pick twenty-five per cent more fruit with it and with greater ease.

Sack forms semi-circle about picker's body—is supported by straps over both shoulders and held tight by belt around body. The picker can thus work with ease either on ground or ladder. When full, it does not extend below the hips.

A great feature of the Brewster Sack is the patent gate (see illustration), WHICH PRACTICALLY ELIMINATES BRUISING. Simply unfasten a hook—the gate drops—and the fruit can be quickly but very gently poured out.

The sack holds as much fruit as the old style sack.

Made of double filled canvas, over strong steel frames; strong sustaining straps; practically indestructible.

Sent express prepaid to any address for $1.50.

With the Citrus Growers

HANDLING THE LEMON CROP.

From "The Status of the American Lemon Industry," by G. Harold Powell, reprinted in bulletin form by the Department, we quote the following regarding the picking and care of the crop.

Picking.

The lemon is picked, irrespective of the degree of maturity of the fruit, when it reaches the approximate size desired by the market. If it is allowed to ripen on the tree the fruit is likely to be overgrown, coarse in texture, lacking in acidity, and of poor keeping quality. In order to judge accurately each picker is provided with a ring to be used in testing the size of the lemons. If the fruit is to be held several weeks or months before shipment, the ring generally has a diameter of 2 5-16 inches, which allows for considerable shrinkage while the fruit is in the storage house. If the lemons are to be shipped soon after picking, the ring usually has a diameter of 2¼ inches. With size rather than maturity as the leading factor in determining when the fruit shall be picked, the lemons vary in color from dark green to yellow, and in texture from the thin skin of the tree-ripened lemons to the coarse green lemons that grow on the outside branches. It is necessary to pick a vigorous-growing grove once a month, on the average, in order to avoid having a large proportion of oversized lemons. In picking the fruit the picker cuts from the tree with shears or clippers the lemons that do not pass through the ring. He also picks the smaller lemons that have ripened on the tree and have reached full growth. The fruit is placed in picking sacks slung over the shoulder of the picker and is hauled in boxes to the packing house. The handling of the fruit in the grove is done with extreme care to avoid cutting it with the clippers, stem puncturing it, or bruising it in other ways.

Handling in the Packing House.

The handling of the fruit after it reaches the packing house is a series of complex operations requiring skill and experience. The fruit has to be cleaned, graded and colored uniformly before it is ready for shipment. In addition, it may be desirable to hold it in storage for several weeks or months for better market conditions.

Washing.

The fruit is first washed by running it between brushes submerged in a tank of water or with water running on to the brushes, to remove the dust or the sooty-mold fungus that follows the black scale. The washing makes the lemons bright and clean. During the season of brown-rot infection, from January to July, the water in the washing tank is usually disinfected with a solution of permanganate of potash or of copper sulphate. When the fruit emerges from the washing machine it passes over a canvas table or a moving-belt table, where it is sorted into three colors, representing different degrees of maturity — the dark green, or unripe; the silver green, or partially mature; and the yellow, or tree-ripened lemons. The different lots are placed in separate boxes or trays in an undried condition, and the dark-green and silver-green lemons are placed in storage separately to color and mature. The tree-ripened yellow lemons are generally shipped at once on account of their comparatively poor keeping quality.

Coloring the Fruit.

If there is a strong demand for fruit from December to March and the weather is cool, the dark-green and silver-green lemons are placed in tight rooms, called "sweat rooms," of a carload capacity each or in tents, and the fruit is colored quickly by raising the temperature to between 90 deg. and 95 deg. F. with wickless kerosene stoves. A pail of water is placed on each burner of the stove to moisten the air to prevent the shriveling of the fruit. Under this treatment a silver-green lemon colors in about four days and a dark-green lemon in six days. If the fruit remains in the sweat room too long the changes go too far, the fruit loses its natural luster, and the keeping quality is supposed to be injured.

Curing and Storing.

The lemons that are not intended to be shipped for several weeks or months are placed in an unpacked condition in boxes or trays in the storage houses, either in canvas tents of a carload capacity arranged in rather open buildings or sheds, or piled in boxes or trays in cellars in which the ventilation is under control. Under these conditions the fruit colors slowly, the moisture evaporates from the skin, and the tissues of the skin shrink, giving it a velvety, tough texture and a bright waxy appearance. The aim is to regulate the temperature and humidity of the tents or cellars, so as to prevent the shriveling of the skin or the saturation of the air with moisture. In the house the lemons are stored without tents in the ventilated basement, and under the tent system on the upper floor. When the fruit is handled properly, a green lemon picked in December may be kept in the tents or cellars in good condition four or five months, January lemons about four months, and condition four or five months, and green lemons picked in February, March and April from two to three months.

In the curing of lemons the fruit is protected from the extreme changes in temperature and humidity of the outside air by the structure of the lemon curing house and by the use of the tents, which may be raised or lowered in accordance with the outside conditions. It appears to be desirable to keep the fruit in the most uniform condition of temperature and humidity possible. In the interior districts, where the changes in temperature and in humidity are more marked than in the coast region, the desired uniformity is maintained by the use of insulated walls and roofs, by the storage of the fruit in basement cellars, and by the further regulation of the interior of the house by ventilation. In addition to this, the equalization of the temperature and humidity may be carried further by the use of tents over the individual stacks of fruit. In the coast region, where the climatic conditions are less variable, the temperature and moisture of the air surrounding the fruit are equalized sufficiently by simply inclosing the fruit in the tents, which are arranged in rather open sheds. These tents are opened at night when desired to cool the fruit, or they are kept open whenever it is unusually

damp and a circulation of air is desired throughout the fruit. The tents are closed whenever the air is unusually dry in order to keep the fruit from shriveling.

Care in Handling.

The handling of the lemon in the packing house is done with more care than is bestowed on any other orchard-fruit crop. The shippers have found from costly experience that the dropping of the fruit or the rough handling of it in any other way is followed by heavy losses from decay. The injunction to "handle the fruit like eggs" is kept constantly before the laborers, and this care in handling is consistently practiced in the well-managed packing houses.

Essentials in Curing.

The regulation of the temperature and humidity in the curing houses, so as to prevent the shriveling of the fruit; the saturation of the air, and the handling of the lemons affected with the brown rot are operations requiring the finest judgment and skill on the part of the managers of the packing houses. At the present time most of these matters are regulated by judgment, but it is not too much to expect that the management of the fruit in curing and storing will soon be reduced to exact scientific methods as the requirements of humidity, temperature and ventilation, as well as other questions, are gradually worked out.

California Farm Names

AN interesting bunch of farm names is given below and indicates that our campaign for naming the home is winning some more each week. The first one of the following shows that at least one home in the state has for more than half a century been carrying its own distinctive name. We believe some of those now being given through the Cultivator will remain with the farm, some of them, many half centuries. We believe it because there is a sentiment and an attractiveness in it which will prevail besides added value from a financial standpoint by this custom.

The tourist visiting the Pacific Coast does not seem to be deterred by the so-called hard times and we find many of them inclined to remain with us. Conversation with them also develops the fact that it is not entirely financial considerations that draw them here. Neither is it always climatic considerations, but the natural beauty of the country and the fact that all the world seems to be looking to California as one of the strong factors which impel them to wish to locate and remain amongst us. The attractiveness may be increased by the beautifying of our farm homes and giving them these attractive and euphonious names.

"Kiwelattah Farm," owner David Wood, Arcata, Humboldt county. Mr. Wood writes us regarding his ranch as follows: "This is probably one of the first farms named in this state. I have a map of the farm drawn by my father with the name on and dated 1865, although the farm was named eight or ten years prior. Kiwelattah was an Indian Chief of several tribes on Humboldt Bay when my father with seven others discovered the bay in December 1849. He was the only Indian that I know of that gave his Indian name, although he was better known by 'Coon Skin.' His son, 'Coon Skin Nick' died on Eel River a few years ago at a very old age."

At first look, that name looked forbidding as it seemed unpronounceable. We wish Mr. Wood had given us the pronounceation. But after one of the office force had given it a euphonious sound, rolling it off the tongue like a native Indian, we decided it a beautiful name. It will be a good idea, when names like this are taken, if subscribers will tell us how to pronounce them.

"Locust Farm," owner H. H. Brown, Bakersfield, Kern county. Mr. Brown writes the Cultivator on neatly printed letter heads with "Locust Farm" the most prominent line, "R. F. D. Number 2, Union Avenue," and on the opposite corner "Poultry, Silver Laced Wyandottes, Brown Leghorns, Stock and Fruits." Mr. Brown writes: "Enclosed find $1.00 renewal for the Cultivator, the best farm paper published on the Pacific Coast. I am glad you advocate the naming of farms. Think it a good idea. Our farm consists of 29 acres, two and one half miles from Bakersfield on Union Avenue. We have a row of locusts along the avenue and around the house. Hence the name."

"Palma Vista," owner John A. Whetstone, Escondido, San Diego county. Mr. Whetstone sends his announcement on stationery, a part of the letter head being a view of the ranch home. The productions of this ranch are oranges and lemons, tangerines being one of the prominent productions. Mr. Whetstone writes: "Allow me to add Palma Vista to your list of farm names. The view from the house suggested the name, only a fifth of the palm bordered drive being included in the cut. I have been much interested in the Farm Names and hope the good work will continue. Success to the Cultivator."

"Edgeland Acres," owner Edgar S. Miller, Elk Grove, Sacramento county. Mr. Miller writes on beautiful embossed linen letter head as follows: "We have been very much interested in your efforts to have people name their ranches. It does add very much to the pleasure of the tourist to see an attractive name displayed and, too, gives an added interest I believe in the ranch to even the home folks. Our ranch adjoins our attractive little village hence the name Edgeland Acres. We find the Cultivator very helpful and wish it many prosperous years."

"Bellflower Ranch," owners Mr. & Mrs. E. G. Nelson, Chino, San Bernardino county. In sending the name to their ranch the Nelsons write: "The place lies 4 miles southeast of Pomona and 2 miles west of Chino. There are 10 acres and they are planted to apples with some walnuts. The chief apples are the White Winter Permain and the Bellflower. Hence

"California Prosperous"

IN a letter replying to an article "California Prosperous," appearing in the department of California Horticulturally in the issue of October 1, a subscriber shows that he has a grievance and thinks many others in this state have also. This is possibly true.

The article in question was written by Mr. Isaac who is located at Sacramento but we believe will be quite generally endorsed over the state, though in some sections and in some lines of production there will be those like the writer of the following letter who will take exception. As the original article may not be at hand we quote nearly half of it as follows:

"There was a financial stringency in the East a year ago but California hardly realized it, while this year may be accounted by farmers of our state as among the most prosperous in our history. Crops, as a rule, have been good, the demand for our products excellent and prices satisfactory. Our agricultural population on the whole have done well, and the country banks are well supplied with money from the deposits of the farmers, while the purchasing power of this important class is greater than ever."

Our critic sends his name and address but these we will not mention as he fears it might injure others in his section, but he has the courage of his own convictions. He says: "I do not have any idea that you will care to publish a few facts in the case but I am going to tell you what I know to be true. But as a matter of fact that article (California Prosperous) is not true—not absolutely so."

Then our subscriber proceeds to show wherein it is not true by his one experience as follows: "I located here a year ago, buying five acres of as good land as there is in this valley. I have worked hard but have been unable to make the products pay my grocery bill, to say nothing of interest on money, wages, etc. I might be led to believe that my failure was due to poor management if my experience was exceptional. But it isn't. Let me tell you what my neighbors have done.

"One gardener, who bought eight acres three years ago, had magnificient crops of all kinds of truck this year. The highest net income for any month of the year—and it took three men and a team to market it—was $60. That means $60 to pay the wages of three men and a team for 30 days, besides interest on an investment of $7500. The average net income for the year this far has amounted to about $35 a month. A pretty good income for three men who worked early and late all the time. They were fortunate enough to sell out a few weeks ago for $1200 less than they had in it."

Some three or four other examples of "red ink farming" are mentioned in the letter. He then adds: "Personally I have been trying for three months to dispose of my property for a thousand dollars less than I have actually spent on it, without success. Real estate dealers—I have been to many of them—declare that they never experienced such a hard time to sell anything as during the past year; that the financial stringency has practically killed all business of this kind, notwithstanding the fact that "California hardly realized it," as you declare.

"If this is one of the most prosperous years in our history what must have been the disaster of former years! May Providence come to the rescue of the poverty stricken ranchers before a really poor year dawns.

"'Excellent demand!' I can cite you a long list of farmers—garden men—who found it absolutely impossible to get one cent for no inconsiderable portion of their crops, many a wagon load of truck being brought back from market to be fed to stock or rot for fertilizer.

"It seems to me it is little short of criminal to send out such misleading reports, thus inducing many a hard working farmer to come here and give up his few dollars in the vain effort to realize some of the fortunes that they have read about in the papers. Once stuck, they see that their only salvation lies in keeping up the impression that the 'fortunes' are really to be made, in the hope of selling out to some other gullible sucker.

"This may sound harsh, but it is gospel truth. Of course it is not 'fit for publication' in California, admittedly the rich man's paradise, but I give you these facts in the hope that they may lead you to tone down your enthusiasm a bit out of consideration for the poor sucker from the East. I have been a newspaper man myself for a score of years and know how an editor is expected to boost, but there should be a limit to this thing for the sake of humanity."

In the first place we may say that if the Cultivator falls into the error of becoming over-enthusiastic and over states things, the calling down and correcting will be most welcome. Hence we have given these extracts from this letter. But is the Cultivator entirely wrong and is our subscriber entirely right? We think if the agricultural (including the horticultural) industries of this state, are taken all together the past year is correctly chronicled in our former article. To be sure the small fruit and truck growers near the large cities have been up against Japanese and other competition which has made the year most discouraging. We do not doubt what our subscriber says is absolutely true, that many people have brought loads of produce to market and been unable to sell. The cantaloupe growers of Imperial valley, looking at it from their own standpoint, would write a letter very similar to the one we have just quoted. Some grain men who sowed their grain on light soil late in the season probably never cut a single straw of their crop. Hop growers have plowed up their yards and some wool growers have decided not to shear till next spring. These are indeed discouraging factors to all engaged in those lines. On the other hand our walnut growers and almond growers are finding this a very satisfactory season. Bartlett pear people receive most excellent prices. Oranges, while not commanding the high prices of last year, have at the same time made a good average and the painstaking citrus grower who has produced fine fruit and used due diligence in marketing has a satisfactory balance as a result of the year's work. The northern cherry grower feels satisfied and, above all, the alfalfa producer, the dairyman and the swine breeder have all had most excellent returns.

Australian Eucalyptus Seed

Our Mr. R. S. Webb (a native Australian) has just returned from that country with seventeen varieties of Eucalyptus seed, comprising the varieties that have been tried in Australia, and each variety is the best for the particular purpose for which it is used, or for the particular soil and climatic conditions where they grow.

The following are some of the varieties of Eucalyptus trees preferred by the lumbermen and manufacturers of Australia:

1. Iron Bark (Panniculata)
2. Microcorys (Tallow Wood)
3. Black Butt (Pilularis)
4. Turpentine (Syncarpis)
5. Resinefera (Mahogany)
6. Tereticornis (Red Gum)
7. Saligna (Blue Gum)
8. Corynocalyx (Sugar Gum)
10. Spotted Gum (Maculata)
11. Jarrah (Marginata)
12. Sideroxylon (Iron Bark)

We will have trees of the above varieties for sale about February 1st.

Sycamore Grove Nurseries
SAINT & WARNER
4584 Pasadena Ave. Los Angeles

No matter how prosperous the times may be there are always some, possibly not through lack of judgment so much as a combination of circumstances, such as glut, choice of wrong crop, etc., who have not succeeded. That is true in business of all lines.

Living in the same section with the writer of that letter is a small fruit and truck grower. Last year this gardener produced on a single acre of ground a net income of $2700. This was not an accident though in part due to a combination of circumstances, nearly all favorable. In the first place he had had nearly a life time experience in the same work in California. Prices were better then, we admit, than this year. The experience coupled with the good soil and the most intelligent care and intense cultivation from start to finish gave these marvelous results.

Could the writer of the letter from which we quoted have accomplished the same results under the same conditions? Most assuredly he could not, for note he says in his letter that he for 20 years was in the newspaper business. He has now been in California one year. Had the gardener who made $2700 on California soil broken away from that and gone into the newspaper business would he have made more success than our critic has in California agriculture? Farming is a science. The marketing of the product is a science. Until it is learned and until we can procure either by co-operation or otherwise better compensation for our labor there will be many disappointing stories just as written to us this week.

We do not think it is the fault of California. We do not think it is the fault of the growers who come here and buy land entirely. At least 90 per cent of the men who engage in business are failures. We do not believe the same percentage holds true in regard to the farmers. Meantime we must be patient and not make too great sacrifices until we solve the problems before us.

IT'S PENNY WISE

Policy to set out a good tree, costing good money, and then let the sun burn the bark or the rabbits gnaw it, when for $1 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow street, Los Angeles.

SALE OF DAIRY STOCK.

The opportunity to secure a fine bunch of dairy stock, or individuals from one, is seldom offered these days. But Southern California county dairymen are now offered their pick from 150 fine dairy cows at public sale which is to be made Wednesday, November 25. This is pronounced to be one of the very finest herds in Southern California and has been selected and bred up for very many years. At the head of the herd is a fine Ayrshire sire, also to be placed on sale. It is the property of the Rancho Verde company, located in San Bernardino county, but for the sale is moved to Clearwater a few miles south of Los Angeles. To reach it take Santa Ana Pacific Electric cars at 6th and Main Streets and get off at Clearwater. The herd is open for inspection to intending buyers several days in advance of the sale. Messrs. Briggs & Weber are the auctioneers.

Lindsay shipped 1072 cars of citrus fruit last year.

Small Fruits and Vegetables

STRAWBERRY CULTURE.

The following is from an interview with Mr. G. H. Hopkins of the Fairview Nurseries of Burbank, Cal. The two Engravings are also used by Mr. Hopkins's courtesy.

TO raise strawberries, one should plan ahead. Plow under a lot of well rotted manure and raise a crop or two of something that requires thorough cultivation of the soil. If irrigation is to be used, level the ground carefully. Then plow and cultivate until the soil is perfectly pulverized.

Set out a full stand of plants. The initial expense is more but it gives quicker returns. Planted 3x2 feet, one acre holds 7000 plants. Planted with the rows 18 inches apart, the plants 12 inches, you can set 28,000 to the acre. Of course if you expect to use a horse in caring for your berries you will have to increase the space between the rows. Plants should never be allowed closer than 10 inches. They may be placed in double rows, 8 to 10 inches apart, or 3 feet from center to center of the rows, with the plants 10 to 12 inches apart and one can get 30,000 berry plants to the acre. Give plants plenty of room to grow and you will have more and larger berries than possible from small plants.

Whatever system is followed, the essential thing is to keep off unnecessary runners and early bloom, cultivate thoroughly, and water when necessary. After each watering, cultivate thoroughly. Quit for a few weeks after the first heavy bearing, and then start in again, watering and cultivating.

One cannot raise good berries to eat and good plants to set out at the same time from the same plants. Have a few rows set apart for letting the runners root to secure plants, and on the rest of your patch keep the runners down, so the plant will devote its reproductive energies to forcing berries.

If you can irrigate, you can raise berries the first year from a crop planted in April. Pick off early blooms and cut off the runners when they start. Water and cultivate well so the plants will make a good growth. You may get a good fall crop and a most satisfactory crop for the next season is assured. But fall planting, the earlier the better, gives the best results. The plants do best in the cool rainy season and your spring crop is certain.

For home use, any good soil will answer for a strawberry bed, but for marketing, a sandy loam will prove best. The berries will have a better color and better shipping qualities.

Hopkin's Berry Fields.

Acres of Berries.

As a general rule, all improvements which a tenant makes upon rented premises at his own expense, and for his own use, which are not so attached to the freebold as to become a part of it, may be removed or disposed of by the tenant when he leaves the premises. Even buildings of considerable size erected by the tenant for his own use may be removed or disposed of by him if it can be done without injury to the rented property. A wooden building standing upon blocks or rollers or resting by its own weight upon a brick or stone foundation, may be removed by the tenant if he erected it at his own expense for his own use. But a brick or stone foundation laid in mortar, even though constructed by the tenant at his own expense, could not be lawfully removed by him, because such a structure is deemed by the law to be so annexed to the land as to have become a part of it. Pumps and water tanks and troughs supplied by the tenant and not so firmly and permanently attached to the premises but that they can be removed without injury thereto, may be removed by the tenant before or at the time when he surrenders possession of the rented premises.

A tenant who has a right to remove improvements in the nature of fixtures which he has placed upon the premises, must do so before he vacates the place. If he neglects to do so he can not return and take them away.

A feed mill or cider mill put upon rented property by the tenant for his own use is his personal property, even though it be affixed to the soil by being staked down. Such articles as these would continue to be the personal property of the tenant although he should not remove them at the end of his term; and while he would be technically a trespasser if he should return to take them, he could replevin them in case the landlord would not permit him to take them.—[Ex.

Live Stock and Dairy

By Mrs. Minna E. Sherman

FOUR DAYS AT THE STATE FARM.

THE State Farm is filled with an enthusiastic body of students enrolled in the Short Courses. The Poultry Course has finished its work. The Dairy Short Course began on the 4th. The dairy school had one woman enrolled. Many women took the poultry course but there were none in the other courses.. It seemed strange as women need this training greatly. A few women, one would think, would realize the opportunity that California affords them as fruit growers. There is need of skilled labor in fruit work; the farmer's wife should be too valuable as a helper to do drudgery. The single sisterhood could do better at creamery work than as teachers and store girls. In every creamery there are men employed; beside the butter maker, usually a canwasher and general helper to clean up. The rest is within a woman's strength. I know this is true for I have often run the separator and churn and on a few rare times have run the engine as well.

State Farm Creamery.

The creamery at Davis is in operation making good butter, that looks very attractive in its parchment paper with the words "University Farm" in blue and gold in a border around it. The butter room is large, in fact a class room. The students are divided into squads and have to clean it up. It is beautifully clean and very attractive. Different separators are in use from day to day. The principal makes being represented, the students soon understand the way to run them, rather than to form the opinion that one is better than the other. The churn and butter worker combined is large and sometimes too large for the somewhat limited amount of cream on hand. Churning and cheese making come on different days, and neither comes every day. Naturally the butter turned out by the students as practice work is not as good as that Mr. Hageman makes. It is good butter, however. We are waiting to see what score it will receive at the Creamery Operators Convention this week.

Barn.

The large barn is completed and is being filled with cows as fast as the money can be secured to purchase them. Some excellent Holsteins and superior Jerseys are in milking at present. The Jerseys are rather better in type than the Holsteins. A bunch of Shorthorns was borrowed for the Short Course work. The scoring of these was on the first day I was there but unfortunately at that hour I had to talk Grapes in the Viticultural Course.

Pioneering.

The State Farm is a big place and the walking bad. The professors and their wives who pioneer at an institution like the one at Davis suffer much annoyance from the primitive conditions. Davis is not a burg of much pretensions, one store having a telephone. The meat shop having none it is necessary to eat eggs or walk to town. The roads are dusty and it is hard to present a neat appearance after having gone even a little way.

The State of California has provided a fine farm but no way to get to it. Some of the students have rooms at a distance from the hotels. They walk to their breakfast and then to the farm, back at noon to town, and in the afternoon back again to the farm, then back again at night. The professors and their wives often have to follow the same weary road, over and over through the dust. The farm needs a bus badly to make at least two trips a day with a five or ten cent fare and the rest paid by the Farm funds.

Dormitories.

The four new dormitories planned will bring the students closer together. One is nearly completed and will soon be furnished. There is as yet no provision for a kitchen and dining room at the farm. The work of building is handicapped by the red tape necessary to secure the materials. It would seem as though money was wasted on stationery and on clerks to make out the formal papers that should be spent on the work in hand. The great value of this farm is in showing the student that farm life need not be drudgery when taken up with intelligent interest. It is making them see that life of every kind, animal or vegetable, is capable of being uplifted.

Special Lectures.

Every Friday night some of the brightest minds sparkle for the enlightenment of the student body. One night Dr. Wheeler talked to them, giving them a wider view of the way others viewed the farm. Then Professor Wickson told of his friend Luther Burbank and of the hybridizations of plants as demonstrated by Mr. Burbank. The Friday night I was there, Judge Shields of Sacramento spoke. He was just from the tiresomness of his successful political campaign. Elected again with almost no dissenting votes, he is an example of the man of wide sympathies. Few realize that Judge Shields was a successful breeder of dairy cows only a few years ago. His talk was on breeding to the best lines of blood to secure the best animals, illustrated at first with the pedigrees of well known horses. He followed out clearly the line breeding as well as the inbreeding of animals, using the records of good and of poor cows to emphasise his points.

The Best.

One remark of Judge Shields was: "Why do you farmers have any thing but the best? Even if it is only a dog have it with a pedigree!" I watched the faces of the men with interest as Judge Shields talked. At first listless, then brightening, and finally into many came the dawning of a resolve to do as he said, "have the best." Faces that were browned with the sun and had looked a little heavy and stolid kindled into enthusiasm with the speaker's ideals. Yes it is inspiring to spend a while at the State Farm. The professors have the welfare of the farmers at heart. Do we respond to them as we should? When only ten or twelve gather at a Farmers' Institute where at least a hun-

dred should come, is it right? Why not go at least ten miles to an Institute?. It is for your own good! The man who is farming the way "Dad did back East" is going to be crowded to the wall by the "book farmer" in the future.—M. E. Sherman.

BACON AND PORK.

I have always cured my pork on the farm, and you don't have to have the evening you kill below 40 degrees to save your meat, says a writer in Farm and Ranch. Here is how I manage it. Get yourself ready to kill and dress your hogs by sundown, wash them down, and let them hang until 8 p. m. Then take down and cut up your hog ready to salt. Take the ribs and the backbone out, and cut off the feet at the upper joint. Cut off the snout and the jowls and split the head open; take out the brains in a dish and wash in salt and water ready for breakfast. Now take the hams and shoulders and trim the extra lard off and place them on the bench with the shank from you and cut the meat with your knife down the shank bone and across the ham or shoulder. Split the bone with a saw; cut through the bone all the way and be sure and split the main joint. Don't cut the meat under the bone. Then, after you have got all the big joints sawed or cut open, take each piece and lay out on a table where it can cool off during the night. Don't salt your meat until early in the morning as salt closes the pores in the meat and does not let the animal heat escape.

Now put the meat down in cold water, using a gallon of salt to 200 pounds of meat and one tablespoon of saltpeter and water enough to cover the meat. Put in the ribs and bones and the head, after it is cleaned, and the feet, after the toes are cut off. (There is nothing about the hog to throw away, but the entrails and the lights after the lard is stripped off—yes, and the kidneys and sometimes the liver if it is not healthy.)

Examine the meat if it gets warm in the middle of the day, and put in more cold water. Then, after supper, go to your smoke house and lay all that meat out on a table where it can drip; and next morning pour off all the first brine and put some fresh dry salt on each piece and pack it down in the box or barrel. Use, as before, one tablespoon of saltpeter to each gallon of salt and rub the salt all over each piece as you pack it. Then, when you get it all packed, use salt only to cover it up. You can and must examine it every afternoon if it's warm weather and see that the meat is perfectly cool. In four or five days you can take it out and rub it over with sugar or, as I prefer, sorghum molasses and red pepper, and after it dries smoke it or use a liquid smoke preparation. Use a similar method in beef, pork or mutton and don't neglect to keep a smokehouse of your own cured meat.

ABSORBENTS IN STABLES.

Absorbents are used in stables first and chiefly for the purpose of absorbing liquids that would otherwise be lost. Second, to hold ammonia that would otherwise escape, especially from horse and sheep manure, and very valuable. It not only contains a large amount of plant food, but it is in a form that is readily available. also to absorb odors that would prove injurious to milk. Third, to add to the quantity of the fertilizer made and saved on the farm. The first of these is, of course, the most important.

The materials used as absorbents of liquids include straw, leaves, moss peat, dry loam and dry muck. Those used to arrest ammonia are gypsum, acid phosphate and earth or peat. Earth in any of its forms is also helpful in keeping down the odors found in cow stables. Straw is used to a far greater extent as an absorbent of liquids than the other ingredients named, but moss, leaves and peat exceed it in absorbing power.

The liquid portion of the manure is The plan frequently adopted in Europe was to save it in tanks and to draw it directly from there and spray it over the land, but this method is, under average conditions, too expensive for America. There is the further objection that when thus kept loss of fertilizing ingredients is very considerable. The aim should be, therefore, to absorb the urine in the litter, and to distribute the same over the land at the earliest possible moment practicable thereafter.

Gypsum has been recommended in stables to prevent the escape of ammonia, not only in the form of gas, but also to retard the loss of nitrogen in manure heaps. To effect this end it has been recommended to scatter the gypsum at the rate of about two pounds per mature animal per day over the manure and liquids in the stable. The applications are to be made two and three times a day. Whether under all conditions this will pay is not quite certain. Authorities are not quite agreed on this point. Some claim that acid phosphate will answer the purpose better.

It is also certain that dry loam muck or peat will not only absorb liquids in stables if applied in sufficient quantity, but that they will also to some extent fix ammonia, and they are very helpful in keeping down offensive odors, such as arise from the manure. The extent to which they should be added will depend largely on the amount of liquid in the manure. This in turn will be considerably dependent on the amount of water in the food. As every dairyman knows, much more liquid is voided by cows pastured or fed on succulent grass or soiling food than those fed on dry food, even though given all the water that they will take.

When much earth is thus added to manure and the manure is thrown out in loose heaps in the yard or under a manure shed, when fermentation follows, the excess of earth by making manure dry out overmuch may aid in the escape of nitrogen. The aim should be to apply manure as soon as made to the greatest extent that may be practicable.

This is one of the great advantages of using absorbents. The liquids are not only saved, but in some instances the escape of ammonia is lessened. The amount of manure made is greatly increased, and because of tnis much more land is manured than would otherwise be possible. This, in some localities, will prove a great matter. Nevertheless, the farmers who burn their straw or even a part of it will not be much influenced by the value of absorbents. The man who burns straw or allows manure when made to lose much of its valuable constituents is not going to pay

much attention to the use of materials that will absorb the liquids in the manure. This man will have first to be convicted of the guilt associated with burning straw or allowing manure to waste. His case is hopeless until this is accomplished.—Professor Thomas Shaw in New England Homestead.

MILK FOR PIGS.

When all has been said and done, there is perhaps no one article of food that is better for the young animal than milk. There is hardly an instance when the addition of milk to a ration for young animals is not desirable. The growing pig is no exception to this rule and, in fact, milk can profitably be fed to a hog until he is ready for market. A hog that is being fitted for show purposes should not be fed an excess of milk, as milk is only for the general utility hog. This rule, however, does not apply to the young show pig. While most of the milk fed to young pigs is skimmed, it seems to have a highly effective tendency to make them thrive, though if analyzed it is shown that the food content in skim milk is not large.

Tables found in the feeding standards show that skim milk, and more especially that obtained from separators, contains slightly in excess of 90 per cent. water. In food constituents that are digestible skim milk contains 2.9 per cent. protein, 5.2 per cent. carbo-hydrates, and .3 of 1 per cent. fat. As compared with ordinary corn skim milk is a little more than one-third as rich in carbo-hydrates and contains rich in protein, about one-twelfth as one-fourteenth as much fat. Notwithstanding the comparatively small amounts of digestible matter found in the skim milk it seems in some way to increase the digestive capacity of the hog and act as a tonic that facilitates rapid growth.—Journal of Agriculture.

FARM NAMES.

Continued from Page 485.

its name. Trees are about 15 years old and produce a very good crop each year."

"White Cliff Fruit and Vegetable Farm," owner W. A. Mayo, Ventura, county. "Our ranch is located on upper Ventura avenue and is bordered on the west by Ventura river, the White Cliffs it takes its name from being on the west side of the river. This is one of the most fertile little valleys in the state where everything planted grows to perfection."

"Spring Vale," owner Frank Tunnell, Los Olivos, Santa Barbara county. "The idea of naming our ranches strikes me as an exceedingly good one. We have only thirty acres one half mile from Los Olivos, the terminus of the narrow gauge railroad. A large spring supplies a nice little stream through the ranch which is filled with water cress making green feed the year round for 250 buff and white leghorn hens. We also keep 20 dairy cows, the cream being separated with tubular valve separator. We feed the skim milk to our chickens and pigs. The cream is shipped to California Creamery, Los Angeles. We have a small orchard, a good vegetable garden, an eight room cottage with shade and ornamental trees and think Spring Vale about the right name for our place." If a picture like that written by Mr. Tunnell does not make the dweller of the dusty city long for just such a little ranch we do not know what will.

"Orange Crest Ranch," owners Mr. and Mrs. F. A. Thornton, Camanche, Calaveras county. Mr. Thornton writes: "Our beautiful ranch is situated on a bench or mesa overlooking the Mokelumne river. We are on the Amador county side of the river. We have a nice grove of oranges which do finely here. We also grow figs, apples, grapes, pears, winter vegetables, and we find that all kinds of fruits and vegetables do well here."

The best feed for making muscle is oats. They are not heating nor very fattening. The young calves should be given oats in order to give them muscle and make them plump.

According to late statistics there are at the present time 19,746,000 horses in the United States. This is a gain during ten years of 40 per cent.

TWO HUNDRED RECIPES FOR ENTERPRISING HOUSEKEEPERS.

Every woman who prides herself upon the variety and tastiness of her "table" will be interested in the new book of recipes by Helen Louise Johnson.

The important point about Miss Johnson's recipe book, which is called the "Enterprising Housekeeper," is that it contains over two hundred tested recipes calling for the use of meats, fowl and other things left over from previous meals. This book will be sent free to any woman sending her name and address to The Enterprise Mfg. Company of Pa., 229 Dauphin Street, Philadelphia.

The primary reason for distributing the cook book "Enterprising Housekeeper" is to demonstrate the possibilities of the "Enterprise" Meat and Food Chopper in the preparation of deliciously appetizing dishes that contribute both to the pleasure of the table and to economy in household maintenance.

The "Enterprise" is the only true Meat and Food Chopper that actually cuts meat so that each minute piece retains its goodness and flavor. The "Enterprise" cuts by means of a four bladed steel knife and perforated steel cutting plate that does the work thoroughly.

With the "Enterprise" Chopper and the "Enterprising Housekeeper" the housewife is ready for guests expected or unexpected, knowing that her table will be a credit to her ability as a versatile cook and housekeeper.

Remember that skim milk is good for poultry as well as for pigs.

THANKSGIVING.

It is possibly in order for the Cultivator to refer to the prosperity which has come to agriculturists as a class during the past twelve months and to show reason why thanks should be given for blessings received. But we think the general condition of our country and reason for such thankfulness are vastly more forcefully and appropriately mentioned in the proclamation of our President, which appears on first cover page.

There will be some who will say that conditions during the past year have been such that we have little to be thankful for, in fact the Cultivator has received during the past few weeks severe criticisms because of references made to certain favorable conditions which prevail along agricultural lines. The year was never yet so auspicious that all producers could feel that they had been blessed as they would like. This is perhaps true of us in general, because naturally the human race is born to sorrow, at least feels so to the extent that knocking comes perfectly natural.

Enough has been given to the California family during the past twelve months that all may at least feel thankful for the privilege of living in this blessed country. The stock and the farmers are not suffering in the driving blizzard, the leaves are green, all the fruit is not yet marketed, flowers are in bloom, our tables are loaded with the products of our ranches, among which are grapes, strawberries, blackberries, raspberries, all kinds of melons, garden products of nearly every kind, while the Easterner is going to church services and to grandfather's to dinuer bundled in furs and overcoats.

Therefore we say to our subscribers stand uuder the blue sky which we hope will be given to us that day and be thankful for the blessings the Almighty has sent us as individuals, as well as to us as a nation.

As we remarked some, will readily find unfortunate occurrences during the year which may be sufficient to feed our grouch. To some the whole year may seem unfortunate. Such we may remind that "whom the Lord loveth He Chasteneth" and the love thus indicated may prepare us for greater service to Him and to our fellow beings.

All have occasion for thankfulness.

Let us express it.

PARCELS POST.

The Cultivator is in receipt of a letter from a valued subscriber at Stockton who referred to the receiving of the blanks sent out by Country Life Commission in which questions were asked as to recommendations for bettering the farmers' condition. This subscriber says that in answering Question Number 5, "Do the farmers of your neighborhood receive from the postal service, rural telephones, etc., the service they should reasonably expect. He answered: "Yes, excepting that we need parcels post." And in the final recommendation he again urged that "If you want to help the farmer give him parcels post."

The subscriber then adds: "It isn't often that the farmer has a chance to tell the President just what he wants. Here is one and if we will all ask for the same thing we may get it. There are many things we need but surely nothing we can reasonably expect will be of more benefit to us than parcels post and I write this hoping you will urge its adoption and that others who have not already sent in their answers may do so and ask fof parcels post."

Any one who has not received the regular blank from the commission may write and express their views addressing "Commission on Country Life, Washington, D. C."

CONVENTION OF FRUIT GROWERS.

In another column may be seen liberal extracts from Commissioner Jeffrey's announcement of the coming state convention. One point which we note in the announcement calls attention to a wise provision of this convention which we believe attendants have long wished. This is the placing of fewer numbers on the program and giving more time to discussion from the floor. This discussion from the floor we believe is of far more value and brings out points which growers actually wish made plain more perfectly than do the long papers which usually fill in the program to the exclusion of discussion. To be sure it requires more careful control on the part of the chairman because of the desire on the part of some to display oratorical powers and ramble in their attempt at discussion.

We believe the coming Sacramento convention will be one of the best in the history of fruit growing, and urge every fruit grower who can possibly attend to do so.

SCIPIO CRAIG.

Scipio Craig the pioneer newspaper man of Redlands died at his home Tuesday afternoon. Mr. Craig was one of the best posted irrigation men in the state of California and has attended, we believe, every session of the National Irrigation Congress. His paper, the Redlands Citrograph, it is announced has been discontinued. It has long been an authority on irrigation matters and has been more of a personal organ to express Mr. Craig's views on irigation than it has been a local newspaper.

The passing of Scipio Craig will leave a vacancy felt by all pioneers and his hosts of friends of this state.

MILK AND CREAM COMPETITION.

The Daily Division of the United States Department of Agriculture will conduct a competition at the coming National Dairy Show to be held in Chicago December 2-10. There will be four products entered for the competition as follows: "4 quarts market milk," "4 pints market cream," "4 quarts certified milk," "4 pints certified cream."

The idea is to attract attention to the requirements of city milk trade and to make awards of gold and silver medals and to give honorable mention to all exhibits which score 90 or above. Entry blanks and information will be given on application to C. B. Lane, Assistant Chief Dairy Division, Department of Agriculture, Washington.

NAME THE HOME.

One of the most interesting pages in the Cultivator this week is that on which appears the list of farm names given by owners who take pride in their own homesteads. This feature of the Cultivator is attracting much favorable comment and is the cause of several giving names to their places who have not done so before. On the other hand it is also bringing out information from some who have carried these names on their homesteads for years. For instance one of those given this week has been carried for more than half a century. We trust the movement will spread and ultimately every farm home in the state be dignified with a name at its gateway.

The Cultivator recently had a short article contributed by a valued subscriber in England and now has promise of one from another in Porto Rico and has in view items from others in foreign countries. We believe they will have value to our subscribers at least in the way of general information. It is a necessity to know how to do things in our own land and is of interest to have information of methods in other countries. That this interest may be gratified we propose to reach out and get this information which we are sure will be appreciated by our increasing family of subscribers.

The Tulare County Citrus Fair will be held in Exeter December 1-5. The Exeter people are making an effort to make this the finest show of citrus fruits Central California has yet made. The Fair has been held two years at Porterville and last year at Lindsay. While citrus fruit will be the principal factor at the Exposition there will be other exhibits somewhat after the style of the regular county fairs. It should prove a drawing card to many thousand people to Exeter.

When I bought my farm I did not know what a bargain I had in the bluebirds, bobolinks and thrushes, which are not charged in the bill. As little did I guess what sublime mornings and sunsets I was buying, what reaches of landscape and what fields and lanes for a tramp.—Ralph Waldo Emerson.

Shop Talk

CLUBBING RATES—This week we wish to suggest to Cultivator readers the matter of clubbing rates, and present on another page a list from which very attractive combinations can be made. The greatly reduced prices which are made, of course, are possible only because of ordering two or three or more magazines at one time. It is not at all necessary, however, that al the subscriptions go to the same address, so it is a great convenience for neighboring families to get together, pick out the magazines wanted, divide the cost, and at the same time have the benefit of the reduced rates.

This is certainly an opportunity not to be overlooked by our readers, as such a carefully arranged list has never before been presented by a Western agricultural paper.

We want to say, too, that the list will not appear again this season, so be sure and cut it out or preserve this issue for future reference. Space is too valuable to allow repeated printing in the paper, although, upon request, copies of the list will be forwarded from this office at any time and to any address.

All necessary rules to be observed in making orders are given in the price list and should be carefully noted. It will be found that most of the popular leading magazines of the country are included, although we will gladly make prices on any others upon request.

Consider the matter and see if there is any reason why you should not have more good reading in the house, and for less money, than has been possible before. Every member of the family should have his or her favorite magazine, to the arrival of which he looks forward in anticipation of many hours of pleasure and profit.

Agricultural Notes of the Pacific Coast

Northern California

Eureka papers report the shipment of 160 tons of butter from that city in one lot.

Colusa is shipping a few oranges, having recently forwarded 100 boxes to San Francisco.

Marin county stockmen have been compelled to haul water for watering because of the drouth.

Many Yolo county, farmers are signing up contracts for beets for next season's deliveries.

Grass fires are not over, as a serious one occurred recently in Eldorado county, near Placerville.

The Colusa Meat and Cold Storage Company have placed a contract for the new machinery to be placed in their new building.

One grower near Tehama, Tehama county, has succeeded well with growing broom corn, raising this year 20 tons from 2 acres.

Articles of incorporation of the Winters Land and Development Company have been filed in Yolo county. Capital stock was $75,000.

Thousands of tons of tules are being gathered along the river in Colusa county and baled for shipment to nurseries for packing trees.

The first car of oranges shipped east from Oroville went on Saturday, the last day of October. The oranges were reported of good color.

Recent experiments in dipping sheep, in Sutter county, under the supervision of the State Veterinarian were declared to be satisfactory.

The dormitory on the State Farm at Davis is receiving its finishing touches and will soon be supplied with furniture ready for the students.

One of the most interesting talks at the Horticultural Short Course at the State Farm was made by the peach specialist, B. E. Hutchinson, of Fresno.

The short course students at Davis State Farm have formed an organization called the Farm Students' Association and have adopted a constitution and by-laws.

The Farmers' Institute train which is now in Sacramento valley received its finishing touches and exhibit at the State Farm before starting, Prof. Clark being chief decorator.

A disastrous fire on the Farm near Woodland, Yolo county, resulted in the destruction of 22 work horses, 60 tons of hay, threshing machine and many other farm implements.

The injunction against the Indiana Mining Company brought by agriculturists near Oroville has been successful and the mining company must cease from filling the channel with slickens.

Stockholders in the Sacramento Valley Beet Sugar Company, many of them from Los Angeles, recently made an inspection tour of the big factory at Hamilton. It is reported that they were pleased with conditions at the factory.

The frame work of the great State Agricultural building on the State House grounds at Sacramento has finally been completely demolished. This building covered a space of 80,000 square feet. The corner stone was laid June 5, 1883.

Central California

Tokays are injured by the recent rain at Lodi.

Lodi is appealing strongly for a new cannery.

Chinese vineyardists at Hanford are exporting their products to China.

Sanger is sending out some fine, well colored cars of Emperor grapes.

Work is rushing for the last arrangements of the citrus fair at Exeter.

Later shipments of Tokays from Lodi crowded close up to $2000 per car.

The San Jose Womau's Club held its annual crysanthemum show last week.

California has a beautiful exhibit palace on the grounds of the Alaska-Yukon exposition.

The most successful ever is the verdict regarding the recent Santa Clara Valley Poultry Show.

Long trains of wagons loaded with apples are a fabiliar sight in front of the packing houses at Watsonville.

A Stanford graduate has been selected to accompany President Roosevelt on his South African trip as a naturalist.

California Creamery Operators' Association held its annual meeting in the Ferry Building at San Francisco, November 12.

Santa Clara valley will make exhibits of some of her magnificient Bartlett pears at the coming Alaska-Yukon Exposition.

The sugar factory at Salinas had a long run this year, not finishing deliveries of beets for the factory until the middle of November.

Fresno raisin growers are still making efforts to complete the raisin pool and bring together all the growers on the 4 cent basis.

Potato growers at Stockton are appealing for protection to the potato industry, saying it is being injured by large importations from Mexico.

Santa Clara valley pear shippers have received reports from London, Eugland, that pears arrived in good condition and commanded good prices.

San Jose Grange Number 10, Patrons of Husbandry, at their recent session discussed the matter of denatured alcohol and its manufacture on the farm.

Poultry raisers of the Santa Clara valley have been discussing the profits in poultry raising and think that they have an ideal section for producing turkeys in large quantities.

Santa Clara valley fruit growers are having trouble with fruit buyers who bought fruit at a fair price earlier in the season but on its decline refused to take any but the very finest of the goods.

The apple growers of Pajaro valley are pleased at the continued dry weather which affords them an opportunity to pick their apples to better advantage. Many growers have already finished for the season.

The Chamber of Commerce at Lodi is endeavoring to discourage the sale of inferior fruit at the passenger trains passing through the towns and urging that only exceptionally fine fruit shall be offered to passing tourists.

Southern California

Orange county is exhibiting pears 17 inches around.

San Jacinto grain farmers have begun seeding grain for next year's crop.

Beaumont is to have a big rabbit drive on the day following Thanksgiving.

Southern California Editorial Association is visiting Imperial valley this week.

Farmers who have held their hay in storage until this time are pleased to find the price gradually climbing.

A potato grower at Fullerton, California, has discovered a case of what is known to be Eastern "black rot."

Tustin packing house is being overhauled and made ready for the coming crop. It shipped last year about 200 cars of fruit.

The property of the Bear Valley Irrigation Company was recently sold at a foreclosure sale at San Bernardino for $1,234,534.

Shooks for orange boxes will be lower than last year, present offers being to supply shooks for 14 cents. The lowest price last year was 19 cents.

A eucalyptus grower on the Bixby ranch west of Santa Ana has 40 Japs constantly at work in lath houses. He will raise several million trees this season.

Plans and specifications for a $25,000 cotton gin have been drawn and are in the hands of the architect at Yuma. The enterprise is being fostered by the government.

With one irrigation for the season one walnut grower at Fullerton has produced 6½ tons of walnuts on 8 acres of 13-year-old trees. He sold the crop for $1600 net.

10,000 trees have been taken from the Government nursery at Lytle Creek canyon, San Bernardino County, and will be transplanted in the mountains at Banning and Mill Creek canyons.

The Board of Supervisors of Imperial county has passed a resolution asking the Reclamation Service to make a survey and estimate of cost of a canal from Laguna Dam into the upper side of the Imperial valley.

Orange county farmers who had bought what was claimed to be beardless barley seed from a large warehouse company but which afterwards proved to be the common bearded kind have been given a judgement of $12,155.

The Chamber of Commerce of Highland, San Bernardino county, is taking steps to have all of the orange trees of that section thoroughly fumigated and to that end is encouraging the plan proposed recently by Mr. Paine to form an organization to insure freedom from scale in all orchards of members.

The Imperial Valley Date Palm and Farming Company has been organized and will have its headquarters at Brawley. The purpose of the organization is to plant 320 acres of land to eucalyptus trees and date palms. The directors for the first year are: J. W. Jennings; J. Lebert Cook; T. A. Kellog; M. D. Witter and W. T. Dunn of Brawley; Mrs. Genevieve Williams and Lewis Havermale of El Centro and W. F. Phelps of Oregon.

The Coast

The Oregon State Poultry Association will be held January 13-19, 1909.

The Seattle Poultry Association holds its annual show January 19-25.

Walnuts grown in Yakima, Washington, have proved to be good bearers and exceptionally good nuts.

It is claimed that one fruit grower near North Yakima cleaned up nearly $4000 from one acre of Buerre d' Anjou pears.

North Yakima, Washington, ranchers have been experimenting this year with manufacturing molasses from watermelon.

Pullman, Washington, is shipping nearly its entire output of apples to St. Louis and is receiving $1 per hundred pounds.

Washington county, Oregon, farmers have been greatly benefited by the special agricultural train and its corps of lecturers.

The state of Oregon ends the year with nearly a million dollars in the treasury and claims not to have one penny of indebtedness.

It is reported that not to exceed 600,000 pounds of wool remain unsold in Oregon and Washington, most of this being in Washington.

The first navel oranges from California this season sold in Portland, Oregon, November 5. They commanded $4.50 to $5.00 per box.

The Northwest Fruit Growers' Association aud the Oregon Board of Horticulture will hold a meeting in the near future at Portland, Oregon.

Farmers near Goldendale, Washington, have lost many hogs during the last few weeks, from the attack of bears that come down from the hills.

Portland hop dealers are pleased with several good sized orders for hops recently. Some of the best grades have commanded as high as 12½ cents.

Portland, Oregon, is now drawing upon Kansas and other middle west states for great quantities of eggs. Some days as high as three cars are received.

Forest fires destroyed thousands of dollars' worth of standing timber; farm houses and outbuildings in Josephine county, Oregon, about the first of the month.

Reports regarding dry farming operations in Utah go to show that it has been successful in producing good crops the past year where other methods have given at least partial failure.

A forty-five acre apple orchard at Salem, Oregon, is now producing some of the finest apples of that state. It is because of intelligent care of the fruit and both summer and winter sprays.

Many horses have died in the farming sections around Baker City, Oregon, during the fall from some unknown cause. It is thought to be from poisoning by fungous growth on the stubble of the grain fields.

Cherry growers in some of the best cherry sections of Oregon are pulling out ten year old Royal Anne cherries and chopping them up for stove wood because the last two seasons have not been so profitable as they had anticipated.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used those machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Egg-More

is not a strong tonic and stimulant, but a highly nitrogenous, concentrated Poultry Food, very rich in protein. A little fed with good grains will keep hens healthy and make them lay lots of eggs. Have you tried it? Many have and are pleased. Here is just one:

F. W. Healy, the well-known banker and fancier of Pasadena, writes: "After hearing others praise Egg-More, I determined that if there was anything to keep hens laying through the fall and winter months, I wanted it. I bought a package of Egg-More and fed it and the improvement was very marked. Keeping on with it I soon proved the truth of your statement that 'you can't put all your eggs in one basket if you feed Egg-More.' I have raised poultry nearly all my life and for twenty years in California, but never did my hens lay so well as since I began to use Egg-More. I consider it the best egg producer on the market, and I do not intend to be without it."

You better try it. For sale by many dealers at 12½ lbs $1.00; 25 lbs., $1.90; 50 lbs., $3.60. If not by yours we will prepay freight on sack within 400 miles.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

POULTRY FOR THANKSGIVING.

WHAT would Thanksgiving be bereft of Poultry? More of the feathered tribe find their way to the table on this day than any other during the year, and a few words on this subject may be timely and appropriate.

Dressing for Market.

There are two ways of dressing poultry for market—dry picked, and scalded. Dry-picked fowls command the highest prices, but the method savors strongly of cruelty, to my notion, as the bird must be picked while still warm, and the usual way is to suspend the fowl by the feet, rap it sharply upon the head, then stick with a sharp knife in the mouth at the root of the tongue. This sticking is quite a knack, and a sharp pointed knife is used which penetrates the brain and causes the blood to flow freely, and while the fowl is bleeding the expert picker will remove every feather, beginning with wing and tail feathers, then the back, from head to tail. Pluck the "craw" crossways, breast and body feathers downward. Great skill is required to do this without tearing the flesh, but when nicely done the bird presents a better appearance for market, while the feathers can be saved and sold, quite an item where many are dressed.

For killing in this way, the French have a knife much like a screw-driver. The fowl is laid on its back, and while one person holds its legs, another opens its mouth and puts the knife just back of the roof of the mouth, pressing in to separate the vertebrae (or bones of the neck,) which kills quickly. It is a nice trick to know just when to begin picking, for if done too soon, blood will settle in the orifices from which the feathers were removed, giving the bird a spotted appearance. Hanging the fowl up to bleed insures its keeping better than where bleeding is not properly done.

Some markets do not require entrails removed, but commonsense dictates their immediate removal, unless the bird has been starved at least 24 hours before killing.

Where the heads are removed, and the scalding process is used, hanging up to bleed is also advisable, and a plentiful supply of water should be used to insure thorough work. In the case of ducks, the carcass should be wrapped in several thicknesses of woolen cloth and let steam before picking, as it is difficult to get the heat through the thick fluff of a duck.

After the fowls are picked, they may be "plumped" by plunging first into a large tub of hot, and immediately into a large tub of very cold, water which fills out the carcass beautifully, then hang in a cool place to drain and allow plenty of time for the animal heat to pass off, then pack in clean straw free from chaff or dust. First put into your box or crate an inch of straw, then a layer of fowls, breasts downwards, not touching each other with plenty of straw between the fowls and between each layer and more on top packed so tightly they cannot jostle around and get bruised.

Mark plainly to whom addressed with the number and weight of the birds, keeping a copy of this for your own use, not depending upon memory.

One bright Pennamite packed a lot of fine Buckeyes and tied them in with blue ribbons and sent them to Philadelphia market marked "Blue Ribbon Buckeyes," and got two cents a pound above market rates, so it pays to take pains with your product and put it out in attractive shape. Commission men soon learn who does their work best, and order accordingly.

Thanksgiving Poultry.

The old Scotch grace has it thusly:

"Some ha'e meat and can na eat,
Some there be who want it,
But we ha'e meat, and we can eat,
Sae let the Lord Be thankit."

And, really, sometimes it seems that Thanksgiving has been degraded into a great gastronomic debauch. And the overloaded stomachs rebel, and throw the whole machinery out of order, so often the results of the feast are colds and fever, which are never suspected of being caused by over-indulgence at the table, yet should be. This year will be celebrated especially, as it is the presidential year, and the settlement of the public mind, after the late excitement, is a good bit to be thankful for. And each individual has something to be thankful for, if he or she will just be honest with themselves, and count their blessings.

Naturally we would all like to have turkey for our Thanksgiving feast, but turkeys are either growing scarcer every year, or else there is so much larger demand than there used to be, that the price puts it out of the reach of many of us.

Supposing we do secure a fine turkey, or even a plump chicken, goose or duck, our first duty upon getting it home is to be sure that the crop and all entrails are safely removed. A young lady I once knew was mortified almost to death at her wedding breakfact by the fact becoming apparent that the crop was still present and full of the bird's last supper, so let us see about this matter and profit by her experience. Next, wash the carcass thoroughly inside and out and rub salt all over the inside, after which hang up to drain a while, say an hour, if possible. Then wipe dry with a clean cloth and proceed to fill with the "stuffing," which should be seasoned to suit the consumers. Some like a simple dressing of fine breadcrumbs, seasoned only with salt, pepper and a little sage, while others like a filling of oysters, onions or raisins, etc. Fill the crop cavity first, then the body, and sew up carefully. Then tie the legs and body together to keep the legs from spreading, and if you have a covered baking pan, no basting will be required, but the following method will answer in place of a covered roaster: Spread a clean white cloth with lard and cover the fowl with this, then grease a paper the same way and put over the cloth, finally laying a heavy brown paper over all, which will keep it moist without basting, and if the brown paper should scorch, take it off and add another one. I like to turn the bird several times while roasting, myself, and always put plenty of water in the pan, so there will be steam.

While the fowl is roasting stew the

giblets, beart, liver and gizzard and ehop them finc, and add, with the water in which they are stewed, to the gravy. In England turkeys and ehickens are more often boiled than roasted, in a large kettle of water contalning a carrot, an onlon and a bunch of swcet herbs.

Roast goose and apple sauee are prime favorites with many for Thanksgiving, while still others really prefer a fine capon to the lordly turkey. Certain it is that "the Lord sends meat, but the other fellow sends eooks," some times, and the finest fowl may be spoiled by indiffcrent eooking, while the poorest one may turn out a winner in the hands of a eareful cook. The main thing is to have the cooking thoroughly done, not underdone.

In seleeting a fowl, remember the young birds have flexible breast bones and bright, smooth shanks, and that four to five hours' gentle heat will give better results than two to three hours' fieree heat.

When we stop to think about it, our national holiday is certainly dependent upon the poultry kingdom for mueh of its good eheer.

If it were not for the hens, where would the delicious pumpkin pie be. or the custards and cakes that grace our board? No successful substitute for the fresh eggs can ever be found, and no "grain and nut" mess can ever take the place of the roast turkey and chieken pie the most of us are accustomed to. I once read of a woman who, in a time of trouble, served a mock turkey, made of mashed potatos moulded into the form of a turkey, and nicely browned in the oven, but I hope none of our readers will be obliged to do this, but that all may have a "leg and wing, and a bit of the breast," this happy Thanksgiving time.—Mrs. Frank Metcalf.

SOUTHERN CALIFORNIA POULTRY SHOW.

Poultry Breeders' Assoeiation of Southern California will hold its next annual, December 31st. to January 6th, 1909. The meeting will be held as the past few have been, at the Chutes Park. Secretary Salisbury writes "Every indieation points to a grand show in spite of the so-called hard times. We intend to have a first class, up-to-date poultry exhibition. There will be many speeial eups and ribbons amongst which are the Rhode Island Club of America eup and ribbon, the National Buff Wyandotte cup and ribbons, the National Orpington cup and ribbons, Barred and White Rock cup and ribbons, National Columbian Wyandottes eup and ribbons, besides about fifty cups from business firms and members of the Association. The show will be held in the large pavilion at the Chutes and there will be no outside show. We have four competent judges to do their part, one of whom is an eastern judge of note. We aim to have this the biggest and best show west of the Rockies."

POULTRY QUERIES.

Pumpkins for Fowls.

What is the effect of feeding pumpkins, seeds and all, ehopped up together, to poultry?—O. W. P., San Jose

Pumpkins themselves have small feeding value for poultry, but the seeds are quite rich in protein, and are also excellent for ridding fowls of intestinal worms, henee the feeding of the whole pumpkin, seeds and all, cannot but have good results, by adding bulk to the ration But, difficulty in getting the birds to eat it may be experienced, unless the mass is well seasoned with bran, and meal, and fed in the form of mash.

"Back East" in winter, when disbes often froze up and cracked, I used to select large pumpkins, halve them nieely and feed the mashes in them, and the birds would usually eat them to the rind in a couple of days, and be the better for it, but my main objeet in using them, was the convenient receptaele they made for mashes.

* * *

Beans for Poultry.

Are Blackeyed Beans a good poultry food, and ean they be given as a substitute for grain, (wheat or corn) and in what quantities? What size is suffieient for run of breeding pen, say for one eock and six hens?—G. Z., Tulare.

Beans of any kind are very rieh in flesh forming elements, and can be safely used as a substitute for corn and meat, if combined with wheat and green food, but will not constitute a perfect ration. An exeellent way to use them is to have a meal made from them, to whieh is added wheat bran, a little salt and red pepper, say a teaspoon of eaeh condiment to a gallon of the mash, and a gallon of the mash for each 30 adult birds twiee a day, with one full feed of wheat at night, or, cook the beans, and add the bran, etc., instead of grinding them. It may be that your fowls will eat the beans without being ground, in which case, a lot of bother is saved, but mine never would. A handfull to each crop, should be allowed at eaeh feed, of the whole beans

Sixty-five square feet is usually considered sufficient for eaeh bird, so a pen of 7 would call for 455 square feet of run, 15x30 would be nearly right.

DUCKS AND GEESE.

When picking dueks do not remove the feathers from the last joint of the wing or from the upper part of the neek near the head. Also leave the main tail feathers on.

Geese will not do well when confined in small yards They need range or at least sufficient room to find plenty of green, fresh grass whieh makes a large per eent of all their food.

Geese may be plucked for the "live geese feathers," so-called, at the end of the breeding season and again when the feathers are grown out and beeome so mature that there is no blood left in the quills.

Always remember that it pays to save the duck feathers if 100 or more dueks are killed during the season. The feathers sell for from 40 to 50 eents a pound and pay for the labor of picking.

Pick out the young ducks and drakes that grow and develop fastest, and that attain good size, for next season's breeders. Some ducks will be heavier at eight weeks than others are at ten, and are therefore more profitable.

If dressed ducks are to be kept after they are dried off when they are taken from the cooling water, they should be at once placed in the icebox. Duek flesh "turns" much more quickly than the flesh of hens or turkeys.

A good mash for the young ducks whieh are to be kept over for breeders is made by mixing one part corn meal, two parts bran, one part boiled vegetables and one-half part beef seraps. These should be mixed dry and moistened with milk or water.—Poultry Hearld.

Buy Chicks Now! Don't Wait

We can sell you baby chicks right now as low in price as when eggs are much cheaper. We can ship safely anywhere within 48 hours. WE HATCH 19 varieties of poultry. Send today for price list; it gives full details how we sell and ship chicks, etc. We have satisfied customers everywhere We guarantee you a square deal. We originated this baby chick business several years ago. Our sales, in 1908, exceeded 230,000 chicks. ducks, turkeys, geese, etc. We hatch all of them in season. Write us today. Call and see us—visitors always welcome.

POULTRY TALK.

Eggs, good, full and sound, can scracely be addled by shaking. There is no vacuum in a fresh egg, and therefore no space to shake the contents out of place. As the chicks come near the time of hatching there is then some danger of shocks, and yet, even in this case, will withstand considerable knocking about. Chicks are hatched in incubators en route to fairs and one of my friends has a chicken house and yard almost jam up against a railroad track where cars switch and rumble all day and night long, and yet she raises droves of chicks each year. These houses shake all the time, and strange horses put into the little stable alongside of the chicken houses, crouch and tremble because of the constant jarring of the floor and walls.—Successful Farming.

Henry Albers Co., 534 So. Main Street Los Angeles

Trap Nested White Leghorns

I trap nest every bird one year before I put them in my breeding yards. and no bird that has not made a record of 13 dozen or better per year is used. I cannot afford to breed neither can I afford to sell eggs from a hen that has not made this record as a pullet. I mate 15 hens to a well matured cockerel or yearling cock bird. My breeders have roomy yards thus assuring strong fertilety. A few choice cockerels for sale.

Eggs $1.50 per 15; $7.50 per 100; $60 per 1000.

S. E. Gregg East Adams St. Reverside, Cal.

Trap-Nested White Wyandottes

Eggs for hatching now ready from fall matings.

MISSION VIEW POULTRY RANCH, MRS. C. D. HUBBARD, SAN FERNANDO, CAL.

HIGHWAY FOUNDATIONS.

Continued from Page 483.

Tonnage.

In California we are transporting from 5,000,000 to 7,000,000 tons of agricultural products annually over imperfect roadways at a cost for such transportation of $10,000,000 to $12,000,000. We are expending $3,000,000 annually on our roadways under a complex system of highway laws which could not be better designed to guarantee that a large proportion of this fund should be wasted. While abandoning the care of the roadways to local authorities, the law hedges the supervisors with such restrictions as to render the upbuilding of an efficient county system an impossibility.

Simplify.

In order to formulate a sane system for the State of California, I would simplify the highway laws, leaving larger powers to local communities in the construction and care of local roadways, but would make the laws more stringent with respect to thoroughfares. But to begin with, we must first have a compulsory system of highway accounting, and this should be provided in our county government bill. Our public roads in California, 50,000 miles in length, embrace practically 400,000 acres of land and thus involve an investment of $40,000,000 for the land alone. Can we afford to permit any set of officials to administer a plant costing $40,000,000 without holding such officials to a strict accounting? The time, method, soil, material, weather, and cost of each and every mile of road construction, and the cost of care and maintenance each year should be a matter of record, and the Board of Supervisors and Clerk of our county assure me that it can be accomplished without extra cost.

With proper accounting for each mile of roadway and enduring milestones along each improved highway, four-fifths of the knotty problems connected with construction would be untangled. Human memory is extremely fallible, hence the value of accounting. In my own county are several stretches of roadway that most men concede have given good service but no two men agree as to just when they were built, what materials were used, how these materials were applied, and what the weather conditions were at the time of application. Consequently the experience gained by the construction of these suitable roadways is irretrievably lost because we have no adequate system of highway accounting.

Civil service should be applied in the whole system of highway administration, and such an adjustment of responsibility arranged as to fix the blame definitely for any serious impairment of highway conditions.

County Improvement.

With a workable county system thus organized, then the state can afford to encourage improved highways by extending aid in the maintenance of such thoroughfares as are put in an acceptable condition. I assume that two-thirds of the highway traffic of any county moves over one-fifth of its road mileage. So improving the main highways in a permanent manner would doubtless require the paving of 10,000 miles of roadway in California, but such improvement would save fully 20 per cent. of the cost of transportation, $1,500,000 to $2,500,000 annually to the producers. The counties can afford to assume debts for such improvement; and for the purpose of encouraging such improvement, the state can afford to provide for the maintenance of these 10,000 miles of roadway when once constructed. As there are few improved roadways in California today, the cost would be merely nominal at the inception of such a plan, and would be inconsiderable for a number of years, but as counties gradually paved with macadam or other acceptable material their main roads, and they were turned over to the care of the state engineer, the expenditures for such maintenance would possibly amount to $100 per mile annually, and when the 10,000 miles have been paved and accepted, the maintenance might cost the state $1,000,000 per year.

Maintenance by State.

This plan would not only guarantee the proper up-keep of the chief thoroughfares of travel, but would hasten the permanent improvement of such main roads by the counties. All of the counties now proceeding under the Savage act to bond for good roads, are going to encounter a serious problem in the maintenance of these roads. There is where the state should extend its aid. A community may afford to create an indebtedness to construct good roads and still not be able to keep them good. Four-fifths of the roads, the by-ways of the rural districts, are still left to be improved and maintained by the counties, and these will be a continuous burden. A good road, when it is a thoroughfare, is an investment for the commerce and convenience of the whole state, and should be maintained by the state.

Instruction at University.

As an aid in reforming our highway service, along scientific lines, I believe that there should be a chair of highway engineering in our college of engineering in the state university. We need specialized engineers for this service, and they should have special training. The foundation of the magnificent system of public highways in France is a college of engineering from which the students are graduated directly into the public service, as they are from West Point into the military service. Incidentally, it would not be amiss if we could have some elementary instruction in our common schools in the matter of public highways. It is a peculiar condition of the public mind, that about nine men out of ten, especially in country districts, assume to have mastered the whole subject of highway construction, one of the most intricate branches of engineering, involving as it does higher mathematics, chemistry, mineralogy, meteorology and civics. Railway engineering is a much less difficult branch of the science, yet not one in ten thousand farmers pretends to be capable of constructing a railroad.

The Need Is Great.

We Californians have greater need than any other commonwealth—first, because the destiny of our interior valleys, our agricultural districts, is to intensify for the culture of choice food products. This means small holdings and a dense population. Second, California is destined to become the playground and resort for the people of the entire land. Our climate beckons the well-to-do and the leisure class, our mountain scenery invites the sight seers, our history invites the curious, while our wonderful resources and rapid development attract the promoter and investor.

We can never have a rival to compete with us for this harvest of guests, if only we exercise foresight in providing comfort and pleasure for their travels.

GOOD WORK FOR THE FARMER.

THE Southern Pacific Company is moving in the matter of inaugurating a series of traveling Farmers' Institutes. They have proposed to place at the service of the State University a train of cars comprising several exhibit cars, lecture car, diner, and Pullman sleeper. A corps of experts from the University will be pressed into service as lecturers and demonstrators and the whole will probably be under the direction of Prof. E. J. Wickson. The object is to present to the farmers of the state the fullest information on all subjects bearing on agriculture and horticulture and do this at their homes. It is not possible for the farmers of the state to attend the University lectures at Berkeley, so it is proposed that the University with all its stores of information shall be taken to them at their homes. The same plan has been worked in many of the eastern states and in Canada and has been a great aid to the farmer and largely increased the output of the farm by encouraging intelligent work. The railroad has generously offered to do its share of the work and its offer will undoubtedly be accepted by the University and the Farmers' Institute on wheels will soon become a fact and operate all over the state during the coming winter.

ALDEN ANDERSON IN THE FINANCIAL WORLD.

Former Lieutenant-governor Alden Anderson, who has been manager for the California Fruit Distributors since its organization, and which institution owes its success largely to his efforts, has resigned his position and will assume the management of the London, Paris and American bank at San Francisco. This is one of the largest financial institutions in the country and his appointment to its management is a mark of the appreciation of Mr. Anderson's ability. It has not yet been made public who is to succeed Mr. Anderson in the management of the Fruit Distributors.

RAIN IN THE NORTH.

Aside from very light showers--a mere trace of rainfall—the first rain of the season in Northern California fell on the evening of the 14th. It was general, although not very heavy.

Some damage was suffered by grapes still on the vine, but not enough to seriously interfere with shipping late grapes so far.

A BONANZA FRUIT SHIPPING YEAR.

We have information that up to and including the 14th inst. there had been shipped through Sacramento, the center of the fresh fruit shipping section, 10,830 carloads of fresh fruits against 6215 to the same date last season. As last season was the heaviest one for fresh fruit shipments up to that time, it will be seen that this industry is making rapid strides, in spite of the old bugaboo of overproduction.

We are informed by Alden Anderson, manager of the California Fruit Distributors, that little damage has been suffered from the late rain and that shipments will continue to go forward for some time yet. It is probable that the total shipments will touch close upon 12,000 cars or, including apples, which will continue to go out through the winter months, will greatly exceed these figures.

NOTHING DOING IN PEAR BLIGHT.

Very little is heard of pear blight nowadays, although it is still with us and as much of a threat to our pear growers as ever. This season it has not been so destructive as usual, due likely to the peculiar climatic conditions of the early spring, but it is still here and cannot be ignored. If neglected, the coming season may be especially favorable for its spread and its destructive work be greater than ever. In every orchard where there has been the least sign of it, it should be fought during the winter months when the trees are dormant and it can be checked, as it cannot be in the summer when the trees are in full growth. Look over your trees during the next two months and cut out every indication of it. The same advice may be given for peach blight, except that cutting is not necessary in this case. In every orchard where the peach blight has been, or in the districts where it is prevalent, early spraying with Bordeaux mixture, full winter strength, should be commenced at once. The earlier in the season this work is done the more effective it will be.

LOOK OUT FOR INFECTED PEACH STOCK.

From present advices there will be a much larger planting of peach stock in orchards the coming season than ever before in any one season. Already the local nurseries have all their stock spoken and will have to place orders in the East to fill the demand. There are two serious peach diseases which are found over a large area of the eastern states and which we do not have in California—the peach yellows and Rosette. Each of these diseases is exceedingly contagious and destructive and once introduced would do for the peach industry of California what the pear blight has done for the pear crop. Our nurserymen, as a rule, are careful not to take any chances on importing diseased stock, but it is up to the County Horticultural Commissioners to protect their counties from the introduction of either of these serious diseases. Do not allow any peach stock to enter It is better in this case to err on the side of security than to take chances of introducing a disease that may ruin one of our greatest horticultural industries.

TO ENCOURAGE BEET GROWING.

One of the richest sections of the State is in the Livermore valley and this being within easy reach of San Francisco, the land has been devoted largely to vegetable growing for the city market. The Alameda Beet Sugar Company has had to compete with this market for the use of the land for beet growing in order to keep their factory at work and not always with success, as the farmers have found it more profitable to grow vegetables for the San Francisco market than beets for the factory. The factory has now advanced the price it will pay for beets from $4.50 to $5.00 per ton and has been signing up a number of contracts at this price for next year's crop.

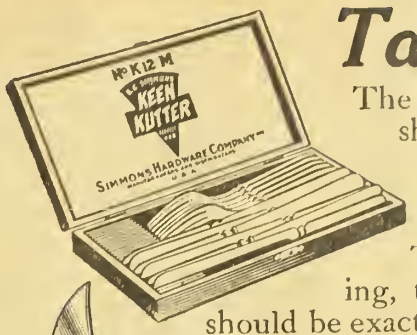

Table Tools

The temper of a carving knife should be unusual—so that the knife will cut easily without being worn out on the sharpening steel. Then, again, for easy carving, the handle and the blade should be exactly balanced for nice work. These are qualities found in all Keen Kutter carving sets.

KEEN KUTTER
Table Cutlery

—from the carving set to the table knives and forks—gives ideal table service. When next buying cutlery be guided by the Keen Kutter name and trademark. It's an absolute guarantee of quality.

The Keen Kutter name and trademark also include a full line of tools, scissors and shears, razors and pocket-knives.

If not at your dealer's write us.

SIMMONS HARDWARE COMPANY (INC.),

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths, Fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Cow Peas for Hay.

I have seen much regarding cow peas for hay. Can it be fed in place of other hay? Do you cut when they have podded or when they are just starting to bloom? How late can they be planted in the fall? Is it too late now? Is it as good as alfalfa?—H. A. H., San Bernardino.

Cow peas would have no value for you planted at this time of the year. They are a warm weather crop and could only be planted early in spring to succeed at all and then would not compare with alfalfa either in quantity or quality. Planting at this time of the year, we would say, next to alfalfa, plant 40 pounds of vetch to the acre, sowing with it about the same amount of barley. This will make an excellent feed and if given a fairly wet season a quantity of it.

Dodder Seed.

I plowed up a piece of alfalfa in April which was badly infected with dodder. Will it be safe if I go ahead and re-seed to alfalfa?—R. T., Escondido.

It is possible if this land was kept thoroughly moistened through the summer that the seed may be germinated and dead by this time. It is probable, however, that another season's clean culture, growing some crop which would permit of such culture, would be safer.

Ascalano Olives.

Can you give me any information about Ascalano olives? I am told they are very valuable, but cannot find that they are much grown.—C. J. F., Hemet.

The Ascalano olive is one of the most valuable for pickling purposes, being very large and exceedingly fine quality, but has the unfortunate habit of bearing light crops. In fact it cannot be grown with profit for that reason.

Charcoal From Mesquite.

Will mesquite make good charcoal? How is the kiln for making charcoal made? What is the demand and market price?—W. O. S., Coachella.

Mesquite will make an excellent charcoal. The kiln is made by standing the wood on end, gradually drawing out at the bottom so as to leave it in the form of a pyramid. After covering, there is a hole left at the top for draft. It is the work of an expert, though by sending to the Department of Agriculture bulletins may be had on the building of the kiln which will aid materially. The demand is very limited. The paying price f. o. b. Los Angeles for first class oak charcoal is 35 cents per 50 pound sack.

Machine Oil from Tallow.

Can you give me recipe for making machine oil from lard or tallow? I tried mixing with coal oil but it would not stay mixed.—H. H., Woodland.

We can give you no very satisfactory formula, and unless you have scruples against patronizing the Standard Oil trust we think it would be far cheaper to buy a good lubricant than to waste time and fuel in the manufacture of one from lard or tallow. However, one is given by Henley's Book of Formulas as follows: Melt in large kettle 10 parts by weight of tallow in 20 parts of rape oil on a moderate fire; add 10 parts freshly and well burnt lime, slaked in 30 or 40 parts water; boil and stir until froth forms and mass sticks to kettle. Burning must be prevented by stirring. Add in portions of 10 parts each, gradually, 70 parts rape oil and boil until it is united into uniform mass. Samples are continually taken to cool quickly on glass plates; they must spin long, fine threads when touched with finger. When this point is reached add, with constant stirring, when the heat has abated sufficiently, 25 to 30 parts of water. Now increase the fire, still stirring, until mass boils. In case of sudden boiling over, remove fire quickly, and have a little cold water always within reach. Add in small portions, so as not to disturb boiling, 500 parts paraffine oil; remove from fire; let mass clarify and skim warm grease from sediment into stirring apparatus. Agitate until mass begins to thicken and cool; if grease is too solid, stir in a little paraffine oil again. Add a little mirbane oil to disguise odor.

Olive Oil.

Please give me the process of extraction of oil from olives.—Subscriber, San Diego.

Of course this could not be given at all in detail in this column, for it is a work of many pages to give particulars. Write for Bulletin 158, published by the Experiment Station, College of Agriculture, Berkeley. In a word, we may say the process consists in drying the fruit somewhat to remove surplus moisture, after which it is crushed and the liquid pressed from the pomace. The liquid is then placed in containers. The oil rises and is racked off, to be later clarified, filtered and bottled.

Lath House.

Is there literature on the construction of the lath house? I wish to make a house about 30 by 32 feet. What height would be the most convenient? —T. Kiyono, League City, Texas.

The Nursery Book by L. H. Bailey, published by McMillan Company, has information, we believe, along this line. The height is not material so the workmen can walk and work in them easily. They are usually made seven feet high, although when used for hanging baskets and general ornaments we have seen them 15 or 16 feet.

Persimmons.

What would be the outlook for a market for Japanese persimmons in commercial quantities? What varieties are best adapted for market purposes? —B. J. O.M., Anderson.

The best information on the persimmon is issued by the Louisiana Experiment Station, located at Baton Rouge. Also in Bulletin 71, issued by Florida Station, Gainesville, Florida This will give you the varieties probably better than can be given in this state. In quantities so far grown there has certainly been good demand for all that has been produced. We imagine, however, it would be limited. This and other persimmon questions have been referred to Mr. Mills, who will later give us some information along the same line.

THE WORLD'S BEST CREAM SEPARATORS KING OF THEM ALL

1910's WORLD'S RECORD **U.S.** FOR CLEAN SKIMMING

Are built more thoroughly, skim more cream, run with less power and have more practical improvements than all other makes combined.

Rex Spray.

"Is the Rex Spray a success and is it advisable when a fruit tree gets tall to cut it back heavily? Where can we obtain alligator pear trees? Is the gas spraying tank a success?"—Subscriber Vacaville.

We have heard the Rex Spray spoken of favorably but are not so situated as to endorse it. The cutting back of any fruit tree depends on its variety and age. It is possible you may secure alligator pear trees of C. P. Taft of Orange, Orange Co. The gas spray proposition we do not think has been tested very fully and can give you no information from any one who has had actual orchard experience.

Garden Magazine.

"Will you kindly tell me where I can secure the best home garden magazine for flower culture."—D. J. B., El Centro.

The Pacific Garden Magazine published at Pasadena is the only one we know of which seems to apply to your conditions.

Cornish Fanciers At a Cornish Dinner.

A FOWL AFFAIR.

On Thursday Oct. 29 Mr. and Mrs. John D. Mercer of Los Angeles gave a Cornish dinner at their beautiful home on Vermont Avenue to about twenty members of the Cornish Fowl Club, in honor of Mr. and Mrs. Williams of Minneapolis who have come to Los Angeles to make that city their home. Mr. and Mrs. Mercer took this delightful method of welcoming Mr. and Mrs. Williams to California, and a social hour was spent around the gay and festive board in discussing the merits of the Cornish fowl.

There was some diversity of opinion as to color and shape of the breed. Yet the discussion was unanimous on the subject of the sumptuous spread which Mr. and Mrs. Mercer so generously gave for the entertainment of the club.

Mr. Williams is Secretary of the American Cornish Club and he and his good wife will be a valuable acquistion to California fanciers, especially to Cornish lovers.

Buff Orpington.

"Kindly give me the name and address of reliable parties raising Standard Buff Orpington. I have not seen any ad for such in the Cultivator."—W. A.

There are not many Orpington advertisers in the Cultivator though we imagine there will be more during the coming season. One of the largest breeders in the state has been with the Cultivator for the past year. We believe the ad appears in each alternate issue. The time is coming now, however, when several other of the best breeders will have their cards inserted and our friend who has been answered by mail will then find the columns of the Cultivator bristling with Orpington announcements.

Apples Named.

"I am sending you three apples grown here on my ranch on Smith Mountain, Palomar, San Diego county. Will you kindly give me their names. This is a fine apple section, apples are grown without irrigation. There is no codling moth, elevation 5000 to 6000 feet. I have taken the Cultivator for years and would not like to do without it."—A. G. H., Nellie.

These apples have been submitted to several qualified to name them so far as possible under the circumstances. In giving the name of an apple, however, from nothing more than a single specimen of fruit one must bear in mind that the diverse conditions of California climate, according to altitude, etc., effect the color and texture so that no one can be absolutely sure. Mr. Matthews of the firm of Ludwig and Matthews, fruit dealers, refused to give any absolute decision in the matter but said under ordinary conditions he would say that the apple which you marked number one, a large greenish yellow with diameter greater from side to side than from stem to blossom end, would be the "Twenty-ounce pippin." Number two a smaller apple somewhat elongated like the sheep nose, a bright red all over though slightly darker on one side, Mr. Matthews judged to be the "Spitzenberg." Number three, also a red apple, brighter and darker red on one side than the Spitzenberg but much lighter on the oposite side was judged to be a "Mammoth Black Twig." This is a very large apple and we note the catalogues give it "large to very large." These apples are still at the office and will be submitted to others and any later information secured will be given.

Grafting Nuts.

"I have seedling walnuts—wild black—in nursery, one year old. I wish to set part of the seedlings in orchard before grafting. Will you kindly tell me when is the best time for transplanting, also may I graft removed trees in the spring, or must I wait a year for root to establish itself?"—D., Nipomo.

The roots may be grafted at time of planting. We think now, however, that if you have them in nursery row you can give them better care for much less money by leaving them in nursery until graft has had one year's growth. Some very successful orchardists, however, even plant the

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

PIONEER ROLL PAPER CO.

Department 11 Los Angeles, Cal.

Household Department

THE DAY BEFORE THANKSGIVING.

The day before Thanksgiving the house smells awful good—
Then I'm always in the kitchen a-bringing in the wood.
A-keeping up the fire and a-helping mother cook,
Stonin' all the raisins; mother doesn't often look
To see if I'm eatin,' for she knows my appetite
And lets me taste the stuffin' to see if it is right.
She makes me small turnovers, sorr of samples of the pies,
And she let's me try the cookies. O, my mother is a prize!
I beat the eggs and help her put the pies and things away.
I think I really have more fun than on Thanksgiving Day.

THE TURKEY'S NEST.

ONE day the old turkey hen went out to find a place to make her nest. She went a long way, and she took a long time to find it, but, when at last she had suited herself, she said:

"They may go to the East and go to the West,
But they'll never be able to find my nest;"

"Then I'll find it," said Cousin Pen, who had come to visit on the farm.

"Then I'll find it," cried brother Fred. "She can't hide a nest from me."

"Then I'll find it," said Cousin Pen,
And they all started out to look for it.

Cousin Pen went down in the hollow and looked in the grasses and leaves, and in the stumps and hollow trees.

"But though she did her very best,
She couln't find the turkey's nest."

Brother Fred went upon the hill to the ginhouse, and down in the cotton field, and round by the goose pond, where he found the Gray Goose and the White Duck taking a swim.

"But though he did his very best,
He couldn't find the turkey's nest."

Little Ben began at home to look. He looked under the house and behind the woodpile and in the barn, and out by the haystack; and while he was tipping about out there he frightened the Brown Hen from her nest, and she quarreled half the day about it.

"But though he did his very best,
He couldn't find the turkey's nest."

Then mama said she must go and look, so she put on her bonnet and

WHEN THE FROST IS ON THE PUMPKIN.

When the frost is on the punkin and the fodder's in the shock.
And you hear the kyouck and gobble of the strutting turkey-cock,
And the clackin' of the guineys, and the cluckin' of the hens,
And the rooster's hallylooyer as he tiptoes on the fence,
O it's then's the times a feller is a-feelin' at his best,
With the risin' sun to greet him from a night of gracious rest,
As he leaves the house bareheaded and goes to feed the stock,
When the frost is on the punkin and the fodder's in the shock.

They's somepin kindo' hearty-like about the atmosphere,
When the heat of Summer's over and the coolin' Fall is here—
Of course we miss the flowers, and the blossoms of the trees,
And the mumble of the hummin' birds and the buzzin' of the bees;
But the air's so appetizin'; and the landscape through the haze
Of a crisp and sunny morning of the early Autumn days
Is a picture that no painter has the coloring' to mock—
When the frost is on the punkin and the fodder's in the shock.

The husky, rusty rustle of the tossols of the corn,
And the raspin' of the tangled leaves, as golden as the morn;
The stubble in the furries—kindo lonesome-like, but still
A-preachin' sermons to us of the barns they growed to fill;
The strawstack in the medder, and the reaper in the shed;
The hosses in their stalls below—the clover overhead!—
O it sets my heart a-clickin' like the tickin' of a clock,
When the frost is on the punkin and the fodder's in the shock!

—By James Whitcomb Riley.

and she felt so proud of herself that she walked all the way home with her head in the air.

When she got to the barnyard, her friends were talking about her. There was the Gray Goose and the White Duck and the Brown Hen, and when they saw her coming they called, "Where did you make your nest?"

"Guess," said the turkey hen, and then they were puzzled.

"Well," said the Gray Goose at last, "when I go to make my nest, I always try to get near the water, for there's nothing so good for my health —so I'll guess the goose pond."

"Right," cried the Duck. "I'll quite agree. The pond is just the place for a family."

"The idea," said the Brown Hen, chuckling to herself; "Why, what could be healthier than hay or straw? I'll guess the haystack."

"But though they did their very best,
They never could guess where she'd made her nest."

The turkey hen grew prouder and prouder, and she walked about the barnyard like a queen. One day the cook saw her, and said to the children, "Certain and sure that old turkey hen has made herself a nest somewhere."

went to the wood-lot, and sat down under a tree just as quiet as she could be. By and by the turkey hen came along. She saw mama and mama saw her, but neither of them said a word. The turkey hen walked round and round in the wood-lot just as if she wasn't thinking about anything, but at last she went through the big gate into the road.

Then mama got up and followed her, just as still as a mouse, and the turkey hen

"Went up the hill and down the hill,
And through the fields and by the mill,
And down across the meadow brook,
By many a turn and many a crook,
She went to the East and she went to the West,
But she never went near her hidden nest."

"I'll give up," said mama, and the old turkey hen was prouder than ever.

Then papa said that he must try; and early one morning before the children were awake, he got up and started out to find the turkey's nest.

"He'll find it if anybody can," said brother Fred, when he was told, and the children could scarcely wait.

He stayed so long that they went down the lane to meet him, and when he saw them coming he called out:

"I declare I've done my very best,
But I can't find that turkey's nest."

And the turkey hen grew prouder

and prouder. She stayed at her nest, wherever it was, nearly all the time then, and only came to the barnyard when she wanted something to eat.

The Gray Goose and the White Duck and the Brown Hen said they wouldn't be surprised at anything she did.

But they were surprised, and so were the children, when one morning she walked into the yard with twelve little turkeys, as fine as you please, walking behind her.

"Just look here," she said, "at my children. I hatched them all out in my nest down in the corner of the old rail fence." And she added, as they gathered to see:

"I tell you what, I did my best,
When I found that place to make my nest."
—Selected.

THANKSGIVING DINNER MENU.

Corn Soup.
Roast Turkey. Cranberries.
Celery Dresing.
Creamed Potatoes. Mashed Turnips.
Pickles. Celery
Pumpkin Pie. Chocolate Tapier.
Coffee. Cake.
Nuts.

Corn Soup.

Chop one can of corn, add one pint of water, simmer twenty minutes, rub through sieve. Scald one pint of milk with a slice of onion; remove onion and add milk to corn, add salt, pepper and thicken with a little butter and flour.

Dressing for Roast Turkey.

Select a fowl not too fat. Have good bread, moderately stale. Mix with a little water, melt two tablespoonfuls of butter, mix with the bread, add sage, pepper, salt and some celery seed. (Unless you have fresh celery.) Mix well; stuff turkey and bake two and one-half hours, basting often.

Potatoes.

Boil till tender, mash, season, add milk and beat with a fork till creamy.

Turnips.

Wash, pare, cut in slices and cook in boiling salted water till tender, drain well, mash fine and season with salt, pepper and butter.

Pumpkin Pie.

For each pie, use one cupful of stewed pumpkin, one cupful of milk, one-half cup of sugar, two tablespoonfuls of melted butter, two tablespoonfuls of molasses, two eggs slightly beaten, one-half teaspoonful of ginger, one-half teaspoonful of salt, one teaspoonful of cinnamon; mix well and bake with lower crust forty-five minutes.

Chocolate Tapioca.

Scald one quart of milk, add one cup of sugar, three tablespoonfuls of melted chocolate, one tablespoonful of cornstarch and three tablespoonfuls of tapioca, which has been soaked in water till soft; boil all together till thick, add flavoring, place in mold and serve with cream and sugar.

ROASTING THE TURKEY.

Carefully pluck the turkey, singe with white paper and wipe it thoroughly with a cloth. Draw it and preserve the liver and gizzard and be particular to remove the gall bag, as no washing will remove the bitter taste it imparts where it touches.

Wash it inside well and wipe with a dry cloth. Cut off the neck close to the back, but leave enough of the crop skin to turn over. Break the leg bones close below the knee. Draw out the strings from the thighs and flatten the breast bone to make it look plump.

Have ready your dressing of bread crumbs, mixed with butter, pepper and salt, some finely shredded parsley, two dozen oysters neatly trimmed. Fill the breast with this and sew the neck over to the back. Be particular that the turkey is firmly trussed. Dredge it lightly with flour and put a piece of butter in the basting ladle; as the butter melts baste the bird with it, allowing fifteen minutes to the pound for roasting. When done and of a nice brown serve with a tureen of nice brown gravy and bread sauce.

The liver should be put under one pinion and the gizzard under the other. Fried sausages are a favorite addition to roast turkey. They make a pretty garnish, besides adding to the flavor. To determine whether the turkey is young try the skin under the wing. If it easily broken it is young. Or turn the wing backward; if the joint yields readily it is tender. A fat fowl is best for any purpose.

Another.

If turkey is too dry for you ordinarily, try the following:

Dress and rub turkey well inside and out with pepper and salt, steam until tender; then rub inside again with salt and pepper, and stuff with dressing made as follows:

Take a loaf of bread, crumble fine, add half a pound of melted butter and enough salt and pepper to season well. Drain off the liquor from a quart of oysters; bring to a boil and skim and pour over bread crumbs, add two eggs, mix well, if too dry, wet with sweet milk. Lastly add the oysters, being careful not to break them. Now fill the turkey with the dressing. flour a cloth and tie over the openings, tying it down with twine.

Spread the breast of fowl with butter. This will run down into the pan and can be used to baste the turkey as the roasting progresses. Put the stuffed fowl into a dripping pan; place in an oven not quite as hot as for roasting meats. Baste often, watching carefully as the turkey begins to brown, turning often, that all parts may be equally exposed to the heat. Roast until a golden brown color. About half an hour before being ready to take from oven baste turkey with butter and dredge with flour.

Take care not to wash off the flour in basting. Do not take it out until it is thoroughly browned, forming a rich, frothy crust, which is very palatable, when served with each piece of fowl.

Never stick with a fork, as this will allow the juice to escape. Serve with cranberry sauce. Wash and stew one quart of cranberries until they break open. Strain and add one pound of white sugar; cook until thickened; pour into a dish to cool.

NO EXCUSE.

Mrs. Hockafus—The idea of your buying a kitchen bellows! What use on earth have you for such a thing as that?

Mr. Hockafus—I don't know that I have any use for it, Lucinda. I suppose I just wanted to blow myself, that's all.—Chicago Tribune.

STUNG.

There was once a bulldog named Caesar
Saw a cat and thought he would taesar,
But the cat was too fiy,
And she scratched out an eye;
Now Caesar just saesar and flaesar.
—Philadelphia Press.

Better walk than never git ennywhere.

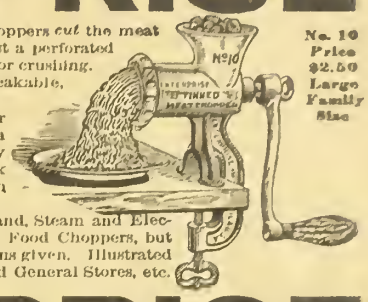
ENTERPRISE

Meat and Food Chopper

"Enterprise" Meat and Food Choppers *cut* the meat with a revolving steel knife against a perforated steel cutting plate without tearing or crushing. Easily cleaned. Practically unbreakable, and will last for years.

The No. 5 "Enterprise" Chopper costs only $1.75. No. 10, shown in cut, $2.50. They are standard family sizes, and not only save half the work at butchering time, but are useful in the kitchen every day in the year.

Made in 45 sizes and styles for Hand, Steam and Electric Power. We also make cheaper Food Choppers, but recommend the above for the reasons given. Illustrated catalog free. Sold at Hardware and General Stores, etc.



No. 10 Price $2.50 Large Family Size

ENTERPRISE

Sausage Stuffer and Lard Press

Lessens the labor at butchering time. Two machines in one. Well made and does its work quickly and surely. Cylinder is bored true and plate fits accurately. Pressure cannot cause meat to rise above the plate. The Patented Corrugated spout prevents air from entering casing, ensuring perfect filling and preservation of sausage.

Machine can be changed into a *Lard Press* in a minute's time. Can also be used as a Fruit Press.

Your dealer should be able to supply you with the "Enterprise" Sausage Stuffer and Lard Press. If not, order direct of makers.

Eggs and Poultry.

Owing to the extremely high price of local extra eggs an immense demand has been made on eastern storage so that storage stock has been run much lower than usual. Prices of storage have thus been compelled to advance while locals are still about as last week or at least only a half cent advance has been made during the week while storage have advanced 4 cents.

Hay.

Reports are freely circulated that a great shortage in hay will prevail this season.

Somers & Co., say: The recent advance in hay prices has attracted an increased amount of hay to market during the past week, which fact has been made possible partly by the relief afforded in several districts by the railroad company in the way of furnishing cars. Arrivals for the week ending today show a total of 3570 ton in comparison with 2210 the week preceding. In spite of this marked increase, prices have advanced for all offerings have been readily absorbed. It is possible that hay may yet be somewhat higher than the present range but relief from outside states will probably prevent any abnormal prices.

Citrus Market

LOS ANGELES, Nov. 18.

Complaint is continually coming in regarding shipments of oranges this year as to their being green, though thus far no serious set-back has occurred as to price paid. It has declined, however, from the earliest quotations. Some feel this will seriously injure the market while others think it will only lessen the consumption to a certain extent and that later on when it is known the oranges are fully ripe prices will recover. Some Tulare county oranges are of small size and will be held on trees until winter shipment.

Lemons are looking up and commanding better prices than formerly. This, in the face of quite extensive receipt of foreigns, the new crop of which are now coming in. The Californias are bringing better prices than the foreigns, at least the better class are. Low grade Californias are somewhat in the dumps.

Shipments.

Shipments from Southern California since November 1st, are 39 cars oranges, 184 cars lemons. From Tulare and Butte counties the shipments of oranges aggregate 498 cars oranges, 15 cars lemons, making a total of 736 cars since Oct. 1st.

NEW YORK, Nov. 16.—Four cars Valencias and four cars lemons sold. The market is unchanged on lemons, but there is a good demand. Valencias unchanged. Clear, favorable.

Queries

Continued from Page 499.

black nut in orchard form, putting two or three where the permanent tree is to be, then allowing the most thrifty to stand, then grafting when it has reached proper age. If you desire to lift these trees and put them in the orchard this spring they may be planted from December to February.

Peanut Butter.

"Will you please inform me through the Cultivator how to make peanut butter, and oblige,"—F. K. H., Pasadena.

Peanut butter is secured through crushing and reducing to a paste the nuts, but the method of procedure we cannot give. If any subscriber can give information to the inquirer it will be appreciated.

Water Cured Olives.

"Please tell me whether olives may be put up or cured by treatment with water only? If so how? I have tried twice and failed, attached hose to bottom of barrel and weighted barrel at top letting water run in at the bottom and out at the top, but the olives get soft before the bitterness has left them."—Old subscriber, Lordsburg.

The process for removing bitterness by the cold water process is a slow and tedious one but gives an excellent result when successful. However it is very uncertain and expensive and the bacterial decay or softening is liable to appear. This is especially true of the ripe fruit. If fruit which is not fully ripe is used and the berries handled exceedingly carefully they may be cured in this way in from 40 to 60 days. The process may be hastened by those who are curing a small quantity of olives by making shallow cuts through the skin of each olive which permits the water to enter and removes the bitterness quicker. We think on the whole you will find much better results by the lye process. In the water process it is not absolutely necessary that the water be running all the time but it must be changed as often as twice daily.

Curing Pork and Hams.

"Please give recipes for pickling pork and hams. What substance makes the best smoke."—J. V. B., Ripon.

A couple of formulas may be seen by turning to Live-stock Department this issue. A good substance for smoking your hams is the good old fashioned corn cob. Some, however, these days prefer the application of liquid smoke which may be purchased ready for application.

Salt Grass.

"A Subscriber" at Laton, Cal. writes, asking regarding Australian Salt Bush for alkaline ground. As the letter has no signature and is in a plain envelope we have no means of knowing who it is from. In fact there is no week but that from one to four or five letters come to our desk without signature and of all these for the last three or four months not one has been objectionable or has contained anything that should induce the writer to withhold his name. Why subscribers see fit to write to us this way is a question we would be glad to have explained. There is a rule of every office in the country to cast unsigned letters into the waste basket.

Another subscriber "C. D. E." at Chatsworth writes a long letter with request for information in the Poultry Department. If C. D. E., or "subscriber" will send in his name we will then turn his letter over to the proper Department and the questions will all be answered. Our query department is becoming more than full and these questions will all be turned over to the waste basket unless signatures are given.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

Diseased Feet of Cattle.

I have fifty head of fat beef steers in prime condition that are having trouble with their feet. The foot swells and gets very sore between the toes and then cracks and swells to the knee, either on a fore or hind foot, and sometimes both. They are fed on No. 1 alfalfa hay and have a clean, dry corral in which they are fed, and good running water. The cattle go down very fast after once affected. Can you tell me what it is, and the cause and remedy?—E. F. B., Central House.

I think you are making a very grave mistake in trusting the above to any diagnosis or treatment that I or any one else could make from the above description, where there is so much at stake.

You do not mention to what extent this inflammation goes, whether any of the animals show a tendency to heal, or do they get worse? Have any recovered, how long since the disease started; do the hoofs crack loose at the coronet (where the hoof and skin join)?

My advice to you is to call on the best veterinarian you can obtain and have a thorough examination made, as there is undoubtedly something you have overlooked.

I should suspect that some chemical in the soil, perhaps alkali, is causing the sores between the digits, and that the swelling above is sympathetic; in which case a cure of the sores would cure the rest; but of this I can not be sure. You might try a saturated solution of sulphate of copper and water, swab the sores once daily, but do not trust to this very long, unless you see some improvement, as procrastination may be expensive. If possible, arrange for them to drink from troughs where they will not have to get into water or mud.

In 1884 an outbreak, the symptons of which read about like yours, started in Kansas. It was first diagnosed as "foot and mouth disease," a very contagious disease, which has never gained a prominent footing on this continent, although it has been introduced several times.

This outbreak caused a terrible scare. Kansas was quarantined, experts were sent by the Federal government and many other states, a thorough investigation took place, and it was finally decided to be "egertine gangrene," caused by egerot, or smut on corn.

If you care to read up on the above, you can get the 1884 report of the Bureau of Animal Industry, at Washington, which contains some very fine colored cuts of the diseased feet and legs.

Southern California handed the East 4954 cars of lemons during the season. This is 1454 in excess of last year. The increase of oranges over the preceeding year was only 554 cars.

California Cultivator

Published Weekly — One Dollar a Year

Los Angeles — November 26, 1908 — San Francisco

Four Favorites of the Poultry Yard

White Wyandotte Cock, Owned by Mrs. C. D. Hubbard, San Fernando, Cal.

THE White Wyandotte male illustrated is the true Wyandotte type, distinct from the Plymouth Rock, in that the Wyandotte is more compact. They are short, round and plump, and have been designated the bird of curves. They are termed the utility man's friend from the fact that they are always fairly well finished from the time they are large enough for broilers till fully matured.

They are good layers of good sized brown shelled eggs.

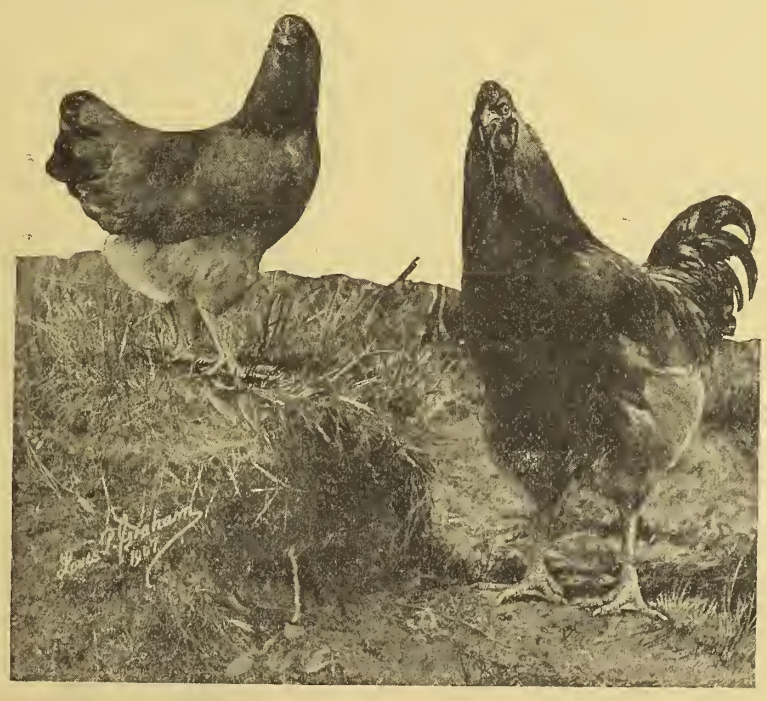
The Whites are the most popular of the eight varieties of the Wyandotte family. They are bred very true to shape. Having orginated from sports of the Silver Wyandottes they inherited the true characteristics of the family.

The Standard Weights for the Wyandotts are, cock 8½ lbs. cockerels 7½ lbs. Hens 6½ lbs. pullets 5½ lbs.

Cornish (Indian) Fowl Cock, Imported by Alex Aikman, East First St., Los Angeles, Cal.

THE Cornish (Indian) fowl one of the oldest breeds represents what may truly be termed a gentleman's fowl. When bred close to Standard requirements they are decidedly a handsome bird. The shape is broad, deep, full, being bred on the lines calculated to carry the largest proportion of meat.

We are glad to note today that they are having quite a revival of their former popularity and we predict the next few years will see them again on top.



A Bunch of Buckeyes, Owned by Mrs. Frank Metcalf,.

BUCKEYES were orginated by Mrs. Metcalf of Warren Ohio. Recently Mrs. Metcalf has located in California and is now regular Department Contributor of the Cultivator. The Buckeye is from a cross of Asiatics, Black, Red and Indian Games. It is a large, well proportioned fowl, resembling Indian Game. They are strong and vigorous about size of American breeds. In color they are much the same as R. I. Reds.

Cornish (Indian) Fowl Hen, Imported by Alex Aikman, East First St., Los Angeles, Cal.

THE White Plymouth Rocks orginated over twenty years ago and were sports from the barred variety. They have enjoyed a wave of popularity extending over a period of 10 years, this is due to their attractive appearance and utility qualities, being very hardy, good layers, and bred remarkably true to color and shape.

Some years ago it was predicted that this variety would rival their ancestors the barred and this is fast becoming a fact for in the largest shows of the country they are already close rivals in numbers to them. Many individual specimens are found to conform closely to the Standard requirements.

They are good foragers, good mothers and good layers; a bird that will not disappoint the fancier or utility breeder.

White Plymouth Pullet, Owned by E. D. Gutting. 136 West Slauson Ave., Los Angeles, Cal.

Dry Farming Somewhat Disappointing

Mr. Arthur R. Briggs, President of the State Board of Trade, Addresses the State Institute, from Which the Following is Taken. He Has Not Found the Method Entirely Satisfactory

IF by "dry farming" is meant the kind of farming a goodly number of grain growers throughout the State experienced this year. I ought to be able to deal with the question somewhat practically and intelligently. If the condition of moisture, or lack of it which I have contended with, and the failure to get any crop worth harvesting, is evidence of being a dry farmer—I am surely a worthy subject of the Dry Farming Congress, and entitled to a life membership therein.

From 480 acres of land in Fresno county seeded to barley in the fall of 1907, to be harvested this year, which land is not under irrigation, and where the rainfall was only 7 inches for the season, which was handled in the way usual among grain growers in that county (I might say in California generally) and from which a return of $6000 was expected, I realized the magnificent sum of $575, and this for sheep feed. In another county, which I will not mention for fear of the consequences that might follow, I was not much more successful. From 640 acres in wheat the returns aggregated $1400, wereas I should with ordinary conditions have received $8000 or $9000 from this field.

These examples are given to assure my hearers if they likewise have any of them been taking lessons this year in growing grain on dry land without artificial irrigation, with similar results, of my full sympathy with them.

The significance of the term "Dry Farming" is likely to be misunderstood. Many who have not given special thought to the subject and therefore are not informed in respect to it, seem to think that through some peculiar process of cultivation or scientific juggling with the soil, crops are grown by that system of farming that could not be produced by any other method of cultivation. At the experimental station in Wyoming, viz: at Cheyenne, under the able direction of J. H. Gordon, quite startling results have been attained. Likewise in Colorado, at Fort Collins, under the management of Dean Carlyle, similar results have been had, but in both these districts the annual rainfall is given at 10 inches and upward.

Conserve.

Dry farming methods under any system, so far as known, do not supply moisture but conserve it. If the precipitation is too slight to produce crops, no amount of cultivation will take the place of it.

At the Dry Farming Congress held in Denver, 1906, much testimony was elicited from farmers to the effect that in the semi-arid districts where dry farming had been pursued most successfully, the rainfall averaged from thirteen to twenty inches annually. It therefore appears that farming in the semi-arid districts without artificial irrigation, to be successful, must be done where there is sufficient precipitation when properly conserved to produce crops; that dry farming involves methods of conserving the moisture, not providing a substitute for it, as well as proper and timely cultivation.

"The system concentrates the limited rainfall of two seasons on one crop by storing most of the moisture in the ground. The great drawback to its rapid adoption is that it means lots of work, more than twice as much as the ordinary farming which takes chances of enough rainfall at the right time."

Conditions in California.

Scientific dry farming loses much of its interest to the average California farmer when he learns that it is successful only in districts where the average rainfall is from ten to twenty inches. Careful farming, in a thorough manner, under methods that have been followed in this state almost since grain growing began here, has given fair, if not always satisfactory returns. Land in the great valleys in seasons when the rainfall has exceeded ten inches, has produced crops that would average eight sacks, an equivalent of 20 bushels of wheat to the acre, and this too at the minimum of cost. What the returns might have been under a rotation of crops or more careful plowing and harrowing, one can easily imagine.

A large part of the San Joaquin Valley is known to give a fair yield in grain with ten inches of rainfall for the season, and when the precipitation reaches fifteen inches the yield is large. Timely rains have given good grain crops in that valley when the aggregate precipitation for the season did not exceed eight inches. If, therefore, the precipitation in the great grain growing districts of California, equalled that shown by the records in the semi-arid districts of Colorado, Wyoming and Utah, where dry farming has been introduced and practiced with the best results, this state would seemingly have small need for the Campbell system of farming for growing grain.

Different descriptions of soil require different treatment. In view of this fact, no arbitrary rule for farming can be laid down with the expectation of reaching equally good results for all descriptions of land under these varied conditions. General principles respecting farm work may be useful, and if followed with intelligence and care, would doubtless be beneficial. To illustrate: the quantity of seed, either wheat or barley, that should be sown depends largely on the character of the land in its natural condition, the rainfall for the season and the time of sowing. That is if sown early in the fall grain stools prolifically, but the stools are less and less when sown as the season for planting advances, until late sowing on light soils stools very little.

Plowing.

In the matter of plowing, whether deep, medium or shallow, experience must largely be the guide also. While experience and observation of many who are engaged in farming is of little value, mainly because they farm by the rule of guess, or by precedent, there are men in every community who farm intelligently and well. The latter are quick to observe results from the introduction of new methods and improved farm implements, and are always ready to take advantage of anything that gives good results.

It has been the custom for generations to permit the soil to lie fallow in the fall. When plowing was done in the fall season it was on the theory that it was a substitute for spring work. Experience has shown that in farming on dry land much efficient work may be done in the fall months. It should be constantly kept in the mind that in the semi-arid regions, especially, the primary purpose of all cultivation is to put the soil in condition which best promotes fertility. Plowing is not just to kill the weeds, or cultivating to keep the surface of the ground loose, but mainly to preserve the moisture.

Immigration into the Semi-Arid West.

In recent years there has been an active immigration to the states and territories in the semi-arid districts of the United States east of the Rocky Mountains attracted thither by the alluring reports of what may be accomplished by scientific farming without artificial irrigation. Lands that have long been regarded as suitable only for grazing have been taken for farming. It is but reasonable to suppose that many of those who have settled on the semi-arid lands in the west, will come short of realizing the expectations held out to them, if in fact they do not become disheartened before any thorough test of the merits has been made. As one writer expresses it, what is needed is greater knowledge of farm conditions and methods. He says:

"Many who have settled upon new lands in the west are under the impression that a slight adaptation of farm methods will enable them to make a success of farming all the time, thus ignoring the plain fact that there are important differences of climate and soil which must be considered. Still others labor under the delusion that all the farmer has to do is to practice good farming under the accepted standard systems in vogue in states where little or no consideration need be given to the water problem. Both of these classes are in need of light. Unless they discover their error before the coming of the inevitable period of extreme dryness, so that they may guard against the drouth dangers, they are sure to meet with losses that will not only be of vast harm to them personally but of incalculable damage to the whole western semi-arid country."

It must be apparent that in dry farming the range of products is quite limited, viz: confined to such crops as can be cultivated during the growing season and close up to the time of harvesting. At the Congress held in Denver in 1906, one farmer living and farming in Utah who claimed to have been able to raise fair crops almost continuously for some years, described his method of growing alfalfa. He planted by use of a drill, in rows far enough apart to enable him to cultivate, the same as he did corn, and thus after each cutting he was able to work the land so as to keep a mulch on the top and conserve the moisture. It will therefore be seen that the statement that dry farming involves "lots of work" is well founded.

Large Areas Having Similar Conditions.

A feature of some significance in considering this system of farming, so far as my observation goes, is that the character of the land in Colorado and Wyoming and to some extent in Utah, is quite different from the lands in California. It may, however, be admitted that better plowing and more frequent harrowing than farmers in this state are in the habit of doing, would seem to be desirable..

But the difference in conditions in California from those in the states where dry farming is now practiced, should not be lost sight of. In this state intensive farming is growing in importance each succeeding year. Grain growing is gradually giving way to other branches of agriculture and the new conditions are not generally favorable to dry farming. Means for irrigation are extending the area of fruits, vegetables and alfalfa year by year throughout the state. The certain-

Continued on Page 513.

The Cost of a Telephone Line

may be divided into two parts—cost of installation and cost of maintenance.

The cost of installation may be a little lower if poor apparatus and equipment are used instead of the best.

The cost of maintenance is always the lowest when the best apparatus and equipment are used. This cost of maintenance should be most carefully considered. Continual repairs and replacements soon equal the original installation cost, for they mean labor charges as well as material cost—a lineman may take half a day to hunt down and replace a defective part that in itself costs but a few cents. The large production of

Western Electric Apparatus and Equipment

means low first cost—low installation cost. The low maintenance cost of Western Electric Apparatus and Equipment is due to the uniformly high quality that has made this apparatus the standard of the world—the only apparatus ever employed by operating companies for long distance work. Western Electric Quality is as necessary in a rural line as elsewhere to insure reliable, satisfactory service and low maintenance cost.

With the Citrus Growers

PRUNING LEMONS.

THE lemon tree is a vigorous and constant grower. When allowed to grow naturally it develops a number of upright shoots and slower growing laterals and may reach a height of 25 to 35 feet, writes G. Harold Powell in his report to the Secretary of Agriculture. With a tree of such large proportions the operations of picking the fruit and of fumigating or spraying the trees would be difficult and expensive. Lemon trees are therefore pruned once or twice each year, the aim being to keep the tree in a low, semi-upright, semi-open form, to make the main branches stocky and strong in order to carry the weight of fruit without breaking or swaying violently in the wind, and to stimulate the growth of fruit-bearing wood all over the tree, especially on the inner branches, which produce the lemons of the finest form and texture.

The trees are seldom entirely dormant, but grow with greater vigor at several periods from spring till fall, and slowly during the winter months. Occasionally an attempt is made to make the trees bear more heavily in the spring and summer by frequent or unusual prunning or irrigation, but the results have been of doubtful benefit. The Eureka is being planted more than other varieties, as it matures a larger proportion of fruit in the spring and summer.

There are a number of systems of pruning and training the lemon tree in use in California. In a general way they consist of shortening the wood, removing the strong-growing suckers, and thinning out the top when it becomes too dense.

In a young tree the main branches, four or five in number, are started about 2 feet from the ground and should not be opposite each other. In general, the pruning for the first three or four years consists in cutting out or shortening to lateral buds the central upright leaders, in order to give the tree an open, laterally upward form. The strong main laterals are also headed in to make them stocky, but the finer fruit-bearing wood is not pruned. The lower branches of the tree are frequently cut back or removed, but should be allowed to develop untouched, as the first fruit that the tree produces is borne on them. These branches should be removed as the tree grows older and the top becomes more dense. Some of the growers do not prune the trees until they have been planted two or three years, when they begin to form the top somewhat after the manner described.

As the trees grow older and the weight of fruit causes the branches to droop, the lateral growth is not often cut back, but the pruning consists in the removal of the sucker wood, in cutting back to 6 to 8 inches, and in thinning out the growth that develops over the top of the tree as a result of the former prunings, especially in a strong-growing variety like the Lisbon. The aim of the pruning is to increase the fruit-bearing area each year and to keep the tree sufficiently open to induce an interior growth of fruit-bearing wood from the strong branches, as the lemons of most perfect form and of thinnest texture are produced in the shaded portions of the tree. The fruit that is exposed to the sun is coarse and is inclined to be flat sided. The lower branches are often kept pruned away from the ground in order to reduce the attacks of the brown rot, which is caused by a fungus growing in the soil.

TULARE COUNTY CITRUS FAIR.

The Tulare County Citrus Fair is to be held next week.

The following is from a statement sent us by the management:

All arrangements for the Third Annual Tulare County Citrus Fair to be held at Exeter, California, from December 1st to the 5th, inclusive, are now completed.

Practically every space in the big pavilion, a corrugated iron structure 50x185 feet, has been taken and the carpenters and decorators are now busily engaged in arranging the interior for the display of the fruit, which promises to eclipse anything of a like nature in quantity and arrangement ever placed on display at a public fair.

At a meeting of the Executive Committee last Friday evening the special days for the different towns of the valley were set as follows:

Wednesday, Dec. 2nd, Lindsay Day.

Thursday, Dec. 3rd, Visalia Day.

Friday, Dec. 4th, Northern Tulare County Day.

Saturday, Dec. 5th, Porterville Day.

If you want to enjoy a day—or five for that matter—of right-down, rattling good time, come to the Citrus Fair at Exeter, California, Dec. 1st to 5th, inclusive. Reduced rates on all railroads.

Resources Become a Menace

An excellent article on the conservation of our farming lands and of the waterways of the nation is given in the August number of the Technical World Magazine. From it we quote the following paragraphs which treat of the menace, and in a later article we will give another installment treating of the remedy. It is a vital question and one which concerns the Western slope fully as much as the Eastern country of which it is written. It is reprinted by permission of the Technical World Magazine.

AMERICA'S immeasurably greatest asset—her inland waterways—is becoming a pronounced menace to the continent's future prosperity, because, through slovenly farming and profligate forest devastations, the streams are now rushing unchecked to the seas, taking with them on their travels the best elements of the fertile lands of the farming valleys.

At the present rate, on most careful estimates by the eminent scientist, Dr. W. J. McGee, this soil waste is much over a billion tons a year; an amount so stupendous that it is beyond the powers of human comprehension. It is worth to the farmers not less than a dollar a ton and as the dangerous conditions are constantly increasing, the ownership of a Mississippi valley farm will soon be a burden rather than a blessing unless the devastation of the river slopes and watersheds be sharply checked.

Shifting bars on river bottoms mean lost farm land; rushing floods of muddy waters tell an eloquent story of piratical forestation and slipshod agriculture. Every ounce of

sediment in flowing streams means lost soil which should be lying between farm furrows bringing grain and vegetables to fruition. Every muddy stream tells its own story of shifting banks and sliding soil.

Nature intended the streams to be clear and sparkling, but stripped river slopes and wasting farms make them raging channels of pollution and forerunners of a constantly increasing national poverty.

Most conspicuous of all such examples are the Missouri and the Mississippi—those giant streams which each day tear from the banks of the states through which they flow enough soil to make an army of farmers independent and which are annually becoming more and more savage as they slip further and further from the leashes in which nature intended they should be held. Farm outlines are being changed every twenty-four hours along those watercourses; the Father of Waters sweeping majestically to the South with thousands of tons of earth carried in the shape of sediment and with the richest soil salts held in solution, by this river erosion robs the farmers by three processes; taking first the solid material which the currents roll seaward on the river bottoms; secondly by the quantities which flow in suspension as a sediment, and last, by the soil salts which disappear in solution.

Few people know what two billion tons means. It is a quantity so stupendous that the mind totters in the attempt to grasp it. The annual tonnage of all American railroads and lake and river transportation lines is little more than half that aggregate.

As the future prosperity of the farmer means the prosperity of the nation, the federal bureaus which aim to prevent the increase of these already startling conditions may, some day, hope for a greater meed of public sympathy and encouragement than is now accorded them.

It is a certain fact that the farmers themselves don't see that the rivers are robbing them. They apparently know but little of the wealth the water brings them and even less of what it takes away. In times of drouth they hope for rain. If it comes they consider themselves in luck, but the real importance of the waters and the fostering and the harboring of them is a closed book. They may appreciate it more after pondering on the impressive statement that 1,000,000 square miles area of American farm lands is in itself not worth a dollar. It is asserted that the value of every farm in the country is determined within ten per cent by the waters in the soil.

Valuable as it is as a servant and terrible as an enemy it can with care be made either one or the other and at the present time it is a most pronounced enemy of prosperity when taking the best portions of the best farms from their resting places and transforming them into ocean flooring.

The Missouri River within the lines of the state of Missouri in all probability tells the story as well as any. That great stream has a length of four hundred miles in the State and its bottom land varies in width from two to three and a half miles. Its brown flood pours between low unprotected banks, tearing at all projecting points and bringing them crashing into its depths. Careful observations show that those banks are slipping and sliding into the flood at an average rate of twenty acres per mile per year—or a total of 8000 acres. That wasted land would make a hundred fine farms worth $100 an acre—the splendid sum of $800,000.

And that tells the story of but four hundred miles of river front out of a total of many thousands.

Not only is this loss of most enormous and immediate importance, but the attendant evils are even more far-reaching. Such waste means flooded low lands as an additional hardship and with all the consequential losses which follow floods. Each year millions of acres are inundated by spring floods; not merely the prairie lands but the more valuable farm lands and the lower portions of cities. Those floods will grow higher annually and they will continue to swell in volume because the checks placed upon all waterways by a wise nature are being torn away by man. The devastation of the forests and slipshod and careless methods of farming must be blamed. Nature intended forests to be protective. Their duty it is to hold the rivers in leash; to maintain the waterways in bounds and to retain that which comes from the skies as rain.

The farms depend upon the forests for these aids but a ruthless and profligate waste of wood—the stripping of river banks and water sheds, has had two effects. It has made raging water spouts of some rivers at certain periods of the year and caused them to run dry in others.

Denuded tracts leave farm lands open to encroaching streams and torrential rains. The rich top soil has been washed through long furrows to the nearest rivulet, creek, brook or river and sent swirling seaward.

With the top soil gone the friable spongy nature of that land has departed and each rain storm robs it more and more of the qualities which make it fit for profitable culture. Rains to laymen are simply rains. To the savants of the Waterways Commission they are "run-off" and "ground water."

In a friable and spongy soil the percentage of "run-off" is scarce worth mention. It practically all becomes "ground water;" gently sinking into the earth and replenishing the subterranean wells; freshening the growing trees and plants and doing exactly what a bountiful Nature meant it should do. With the spongy top soil gone the rains dash pitilessly down; fail to work through the more closely packed under soil and as "run-off" tear more and more earth and carry it as they disappear.

During the month of February, 1908, a bureau of the Department of Agriculture prepared a table of comparisons which proved that in the producing of so-called standard crops seven countries of the old world made a greater production per acre than did the United States. The showing in some branches was startling. Farmers in tiny Belgium were taking thirty-four bushels of wheat off of every acre sown to that cereal while American farmers were getting fifteen; that in Ireland 244 bushels of potatoes was an average acreage yield, while here but ninety-three were produced; that in wheat, rye, buckwheat, barley and potatoes English, Irish, German, Dutch and Belgium agriculturists made their acres give from one and three-quarters to four times as much as America's supposedly more intelligent farmers though Americans work with more modern implements and on supposedly better land.

The "intensive" farming on the proportionately smaller farms of Europe accounts for that pitiable showing only to a degree, the rabid and rapid destruction of the forests and the devastating influence of the rushing waterways being really the big and truthful reasons.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths, Fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials

Deciduous Fruit Culture

By J. W. Mills

CARE OF A VINEYARD.

The first year of vineyard work it is hard to keep the vines watered and cultivated under $15.00 a year. The second year costs about twelve, the third year eight to ten dollars a year. Then the cost remains about the same year after year. The cutting vineyard costs about eighteen dollars a year the first year, then fifteen dollars for the next year and eigh to ten after that time. The relative cost of planting roots and cuttings is about the same, if the work is properly done. Planting cuttings with a crow-bar is a poor way to secure a good setting of vines.

Now, the expense of a cutting vineyard may not seem to be great but every dollar counts and will be very welcome before the vines become profitable, for the bank account feels rather weary and used up. Vineyards are like jelly-fish they have many tentacles to grasp money, so that it often seems to require a golden shower to bring a large place into bearing.

If the money must be spent, do not spend it in planting cuttings, but save the money to grow cover crops. When rootings are to be planted, a second selection has eliminated the weak, and the vineyard should be a 98 per cent stand.

The Best.

It pays always to have the best and to do the best with it. I often wonder that anyone is satisfied to plant second quality trees or vines

The young vines bear transplanting well but, after one year old, it gives them a shock. So it seems foolish to plant two year old roots. If there are a few misses, plant in one year old vines.

Watch 'Em Grow.

It is very interesting to watch the young vines develop. The little shoots are greatly in earnest, as they reach out of the ground determined to grasp something and hold it. If all the world was as much in earnest as the young vines the world would hum with activeness. The tiny vine grows on, making use of every drop of water and every bit of sunshine. Some of the young shoots spread out on the ground, others stand up in the air; every leaf plans to secure its portion of the warm sunshine. Bend down a shoot and put a clod on it, every breath of wind that stirs the leaves, every brush of a chance passer by, will be utilized by the shoot to struggle out from under the clod.

Pruning.

The first spring-time has come in the young vineyard. The flowers appear on the earth; the time of the singing of birds is come and the voice of the turtle dove is heard in our land. The fig tree putteth forth her green leaves and the vine with the tender grape gives a good smell.

At the end of the first year's growth the tiny vine is pruned back to one upright cane, cutting off above a good eye as near to the right height for a head as possible. The first year's pruning does not differ in the different varieties of grapes. One important thing is during the first two or three years to remove the suckers, going down to where they leave the trunk and taking them off clean.

The second year's pruning the vines are usually shaped toward the ultimate style of pruning that the mature vine will require. The third year of a vineyard's growth it is well to run the plows on one side of the vines about four inches deep, cutting the roots close to the trunk. This will encourage deep rooting; surface roots do not enable the vines to stand great heat. Run the plows close to one side only and, at once, throw a back furrow to fill. Fill this furrow to prevent the ground drying out. The fourth year a similar furrow is run on the other side of the vines.

In the large vineyards, six two-horse plows, three one-horse, and one wide harrow will usually keep the work running smoothly along. Each day the harrow should cover the land; without it, we are losing the moisture. The importance of following the plowing up with either a harrow or discs can be shown by examining the work of the plows, it will be seen that the plows often leave a hollow place under furrows; this the harrow fills with soft light earth.

The Merciful Man.

The horses need watching, as plowing makes sore shoulders. The common use of heavy pads on the shoulders to make ill fitting collars set better is not good; the pads heat and scald the animal skin. The collars should be carefully fitted the beginning of the working season and then numbered with white paint the number of the stall the horses stand in. When buying new harness take the team to have it fitted just as carefully as you would your own clothes.

The ends of the singletrees are readily protected from any chance of tearing the young vines by slipping over the end a piece of leather or rubber hose. The junk shop men will find this in the two inch size in two foot lengths. This covering, also, protects the horses' legs from chafing when the narrow singletrees are in use.

About Humus.

The growing of grapes saps the land more than people are willing to recognize. The clean culture exposing the land constantly to the sun and never turning down any green growth, soon exhausts the humus in the land. Barnyard manure has become more and more filled with bermuda grass, Johnson grass and morning glory, until it is hardly safe to use it without having first rotted it in cement vats. Fortunately, the land can be cheaply filled with humus by growing cover crops. As yet we have not been able to secure a good growth of peas in the vineyards before the time comes to cultivate. Burr clover does well and does not have to be inoculated. We turned it under last spring as high as the breasts of the horses. The principle trouble in growing cover crops is that they are usually not turned under green enough. When they are green they are full of moisture and rot at once.

The vineyard infested with Johnson grass and Bermuda and morning glory must be handled carefully. As soon as the crop is gathered, plow and harrow the infested spots and burn the stuff on the ground, then rake it with hand rakes and burn it again. Rake off the Johnson grass into piles and burn when dry. Next summer keep the weed knives busy on these spots.

Sycamore Grove Nurseries
SAINT & WARNER
4584 Pasadena Ave. Los Angeles

Glenn county has a fine exhibit of her products in the Ferry Building,

Johnson grass may be controlled, if, for several seasons, it is never allowed to seed. The habit of the plant is to root shallow until it forms seed, then it sends down deep roots. If the seeding is prevented in summer, the next winter there will only be shallow roots that can be easily raked out and burned.

Pests.

Morning glory may be controlled in a measure by spraying. The sulphate of iron spray will kill the foliage and if it is persisted in should destroy it completely. Next season the morning glory will be sprayed every two weeks, and we will then know if this will cure it.

These pests are outside the vines. There are several things that affect the growth directly of perfect fruit. One of these is mildew. Sulphuring in spring or early summer will control it and as additional precautions in winter spray with a good solution of Bordeaux mixture. A 4-4-40 solution is the old formula.

If the infection has been very great the spraying with lime, salt and sulphur is advisable. Do not spray in a rain storm and expect results. We had a foreman who during our absence from home sprayed during a week of rain! He thought he deserved great credit for his persistency. The idea has to be hammered into the men that work on a vineyard is to grow grapes, not merely to plow, prune, and cultivate for the fun of doing it or for the joy of paying wages to help the poor working man.

"Honorable" Care.

I like the Japanese way of saying the "honorable plowing." Why not honorable? For if it is done in an honorable way we are building up character as well as making crops. The daily endurance of Nature's snubs and the overcoming of the desire to frivol away the time of men and horses in "look pretty work," putting on frills instead of doing steadily every day's plowing, which is the constant temptation. The head must be held high and the hand not falter to put honor into the plowing.

Surely living on a California vineyard makes life rich in beauty.

What need have we for pictures when Nature shows her beauty? Or for poetry when the winds sing in the trees? Or for music when the birds sing all day long?

Spring and summer have their attractiveness but winter is not bare. The cold tule fog has closed down on the land during January and the gray clouds trail on the red, brown earth. The moist air carries the sounds far—the voices of the men and the chink, chink of the harness chains are heard long before the horses come into sight. A minute of denser fog, whiter with the breath of the horses, and they slowly come into view straight down the furrows. The fog makes them appear as though they were rising up a hill as they move slowly along in wreathes of steam. The faces, browned by the sun, of men in their blue clothing wear smiles of placid contenment, for theirs is joy in turning the furrows. The plow teams come on and on, up the foggy vineyard. Bay, black, gray and white horses, one after another, until all have passed into the little circle of our vision and then passed on into the fog. The fog closes behind them and we are alone in the wonderful stillness. Only the brown furrows newly turned and the sweet fresh smell of the earth! What does it matter, we are the only thing that can voice the sentiment "That it is good to be with Nature." Our great mother Nature will not endure idleness but makes unhappy all that do not follow the divine law of earning their bread. So away to work again!

The farmer and vineyardist earns his bread in the sweetness and peace of the quiet fields under the blue skies. It is blessed to live away from the daily grind of the ceaseless toil of the busy city and to be alone with Nature in the enduring quiet of the country.—M. E. Sherman, Fresno,

CROWN GALL

Colorado fruit growers have long known of the destructive nature of crown gall to all kinds of fruit trees. There seem to be some conditions here which make the disease much more destructive than in the humid states. In fact it has caused so little damage in the East that nurserymen come to regard it as harmless. This probably accounts for the attitude of eastern nurserymen toward our inspection laws. Not a spring passes but what some of our inspectors are threatened with damage suits by some nurseryman who has had his stock condemned. Some nurserymen claim not to have heard of the disease before.

About four years ago the U. S. Department of Agriculture published the results of some experiments with crown gall which apparently proved that it is not harmful to apple trees. While this may be true under the conditions at St. Louis, where the experiments were conducted, every Colorado fruit grower of a few years' experience knows that here the reverse is true. Experience has shown our fruit growers that a great many trees die each year from this cause. And it has been noticed in a great many instances that if a badly infected tree is planted, it rarely makes much of a growth and it usually dies before it is ten years old.

The cause of the disease has been obscure, though Toomey, of Arizona, tried to prove that a certain fungus was responsible. No one has ever been able to duplicate his results, consequently it has never been fully accepted. Doctors Smith and Townsend of the Department of Agriculture have recently found that a gall on the Paris daisy is due to the attacks of a bacterium. They have also found that when peach trees are inoculated with a pure culture of these germs, galls are produced which closely resemble the common crown gall.

It now seems probable that the true nature of crown gall will be discovered; but it is not at all likely that the results will modify our treatment of diseased trees.

In the meantime the inspection of nursery stock should continue to be as rigid as in the past, and it is likely that the interests of all will be best served if all diseased trees are destroyed as soon as discovered.—W. Paddock, Colorado Agricultural College..

A few mulberry trees set out around the fruit orchard will divert the attention of the birds.

Pick the apples as soon as ripe and then store in a cool place immediately

---

Don't be afraid to put plenty of stable manure upon the orchard.

Imperial Valley Lands have a greater earning capacity per acre than any land on earth. For price list and information address, James S. White Jr., and R. A. Holt, Holtville, Cal.

The Ornamental Garden

SHADE TREE PRUNING.

IN the matter of pruning, each tree presents a special problem, depending upon the species of tree, its location, and the ideals of its owner. It is possible, therefore, to give only the principles that should govern the process. Certain things should be kept in mind in trimming any tree. First, the removal of a large part of the top tends to give rise to many slender branches, usually in bunches, while the stubs of large branches often die back some distance and make an unsightly top. If possible, a tree should be pruned so as to appear pleasing when the leaves are off as well as in summer. If it is necessary to cut back large branches, this should be done just above a smaller side branch, or they should be entirely removed. The severe heading back of large trees is usually disastrous unless plenty of small branches are left to bear foliage and enable the tree to recover quickly. Tall growing kinds should be cut back when young if the top is wanted low and some attention given each year to pruning.

Second, the formation of crotches or forks is to be avoided, as the tree is apt to split at such places with strong wind. Cutting off one branch of the fork while small will prevent this.

Third, remember that a small branch may become a large one, if the part above is to be removed. Furthermore, such shortening of a branch will cause the thickening of the part left on and consequent strengthening of the branch.

Fourth, if a branch is shaded too much, it is killed, while the opposite is true where sunlight is abundant. For this reason weak branches, if in desirable places, can be encouraged by cutting out those that shade them. Thinning the top of a tree by taking out some of the largest branches will tend to thicken it in time without making an unsightly top.

Fifth, study each tree carefully before cutting it and try to retain its characteristic natural grace and beauty.—B. O. Longyear, Associate Professor of Botany, Colorado Agricultural College.

ROSE CLIMBERS.

In plant life in California the rose is a staple article. In street decoration in general the climber roses are certainly staple. Almost any desired effect may be attained with roses. Blossoms and good rose foliage may be had throughout the year. For such purpose I would first name that generous blooming, rapid grower, the banksia, yellow or white, hardy and an almost endless grower. Also that large family, the ramblers, red, pink, yellow and white. For richer foliage and choicer blooms we have the beautiful single Cherokee, recently, through the genius of Burbank, propagated also in pink. Among the best I would class the Beauty of Glazenwood — known to many of us as the Hester. In yellow, one of the hardiest, climbing, ever blooming roses of exceedingly rapid growth even when given scant care, is the Per d'Or. The La Marque and Niphites are good examples in white—good and sensible. In pinks, Hermosa and the Emperor of China.

I know a landscape gardener of wide reputation who warmly recommends the homely potato vine for public use. I have seen some very unsightly bridge approaches made very attractive by its liberal use. Seemingly the potato vine will struggle along, roaming over ugly woody surfaces just for the love of struggling, while in gratitude for trivial attention in the way of a little water it will climb by leaps and bounds.—Exchange.

WATER-LILY POND.

We find lily ponds the most attractive features of the floral display in our public pleasure grounds. In nearly all large parks these ponds are found, filled with beautiful lilies of pink, blue, white and yellow. It seems to be the general impression that these lily ponds are appropriate only for these extensive pleasure grounds or the broad lawns of a large estate; also that only experienced gardeners and florists can successfully cultivate water-lilies, says a writer in Country Gentleman. Mistaken ideas, both of them! All flower-lovers may enjoy these beautiful flowers this summer, and for many summers to come, with very little care or expense. No matter how small the yard, choose a pond in proportion, and make your plans for the summer beauty.

It will be unnecessary to prepare the large cemented ponds similar to those noticed in the parks. A half barrel will do, or a wooden cistern, four, six or more feet in diameter. Whether you decide on the large cemented pond, a wooden one, or simply the small affair made from a half-barrel, it will be well to make your plans early, especially if you are to raise your plants from seed.

The half-barrel pond, which is easily constructed, will be described first, and the same principles may be carried out in the larger ones. Select a large, strong barrel, or rather a cask with iron hoops, and have it sawed directly through the center. Sink half of it in the ground (or both halves if you have room for the two ponds) to within an inch or two of the rim. If possible, use the soil from a natural lily pond—pond muck, as it is called; but if this cannot be obtained, leaf mold or light garden soil, mixed with manure and sand, will be satisfactory.

If it is possible to obtain the natural pond muck, you may also be able to secure a few roots of the common white water-lily, and it may be well to experiment with these before buying the more expensive varieties. After the tub or half-barrel is sunk in the ground and in position, fill in the natural or prepared soil to a depth of 6 or 8 inches; lay the lily roots carefully on the soil, placing each small fiber in its proper position, and cover with two or three inches of fresh soil, pressing it firmly about the roots, so that they will not be washed away; then pour in the water slowly and carefully, watching to see that the plants are not disturbed.

In filling the pond with water after planting the lilies, do not fill it full at first; simply keep the water a few inches above the growing plants, until at last the pond will be full of water, with the large, shining green leaves floating on the surface.

HE DIDN'T MEAN THAT.

Marks—"Say, old man, did I ever tell you about the awful fright I got on my wedding day?"

Parks—"S-s-h-h! No man should speak that way about his wife!"—Clover.

CALIFORNIA FRUITS AND HOW TO GROW THEM.

A book which may prove to be an epoch maker in California horticultural history is possibly a distinction which may be earned by the work written by Professor E. J. Wickson of the State University. The work is the revision of "California fruits and how to grow them," brought out first by the Dewey Publishing Co. in 1889, reproduced by them in revised form in 1891, a third edition issued in 1898, and now reprinted by the Kruckeburg Press of Los Angeles. This book therefore is a fourth edition of this useful work. It is, as one would expect, a vast improvement over any of the former editions and the improvement is great both in reading matter and in mechanical make-ups so that it is a most pleasant surprise.

Typographically it is a complete change from the former editions in shape, eight by ten and a half inches. Instead of the single column it is put up in wide measure and two columns to the page. There are four hundred aud thirty-three of these large pages and a vast number of half-tone illustrations, together with two three-color plates of figs and of plums. It is divided into ten parts, namely: "General; Agricultural; Orchard; Fruits; The Grape; Semi-Tropical Fruits; Small Fruits; Nuts; Fruit Preservation; Fruit Protection and Miscellaneous.

The first six chapters which make up Part One, treat of the climate, its modifications and effects upon the growth of fruit; also of the soils and the early introduction of fruits by the Mission fathers and the later introduction of newer varieties. This part is very much the same as in the original edition. The changes in the book come in the later parts, speaking of cultural methods, and giving most up-to-date ideas of handling orchards and fruits. Regarding the advantage which California holds in fruit production we note the following: "The three great advantages of the California climate—abundant heat, continuous sunshine, and dry air—taken in connection with the fitness of the soil and the great length of the growing season, insure the characteristic excellence of California fruit, and the early maturity, great growth and abundant fruitage of our trees and vines. Heat, sunshine, dry air, and a rainless summer also minister directly to the curing of fruits in the open air. All things considered, it is doubtful whether any area in the world excels California in possession of natural adaptation to fruit production and preservation."

The book is good value at $3.00, but it will be sent postpaid with the Cultivator for one year, for $3.50.

THE CENTURY MAGAZINE.

A series of articles ou Lincoln's life and character--to include hitherto unpublished documents from his own pen and that of one of his secretaries, will be one of the stroug features of The Century in 1909. Frederick Trevor Hill has written of "The Lincoln-Douglas Debates," the fiftieth anniversary of which occurs this year; and there will be later papers on "Lincoln as a Boy Knew Him," "Lincoln as a Peace Negotiator," "Lincoln and the Theater," etc.

The olive crop about Winters will be much lighter than usual.

DRY FARMING.

Continued from Page 507.

ty of profitable returns from farming by irrigation, as against the uncertainty under a system of dry farming, makes the former in every way desirable.

Then, too, it would not be practicable to produce many of the fruits and other products grown in this state, if only the natural precipitation was to be had, no matter how carefully and scientifically it was conserved.

Many fruit growers in this state, without claiming to follow any scientific system, do in practice adopt the Campbell system pretty closely in some respects without knowing it. [In fact, long before there was any so-called Campbell system, California orchardists were practicing arid farming, many of them scientifically. Ed.] In other words, experience has shown them that the minimum of water and the maximum of cultivation give the best results. Instead of applying all the water to their orchards and vineyards that the land will take, as was done some years ago, the tendency now is to use only sufficient water to keep the land in good productive condition by faithful and continuous cultivation through as long a period in the year as practicable.

Irrigation the Important Feature In This State.

It does not seem to me that in this state the question of how crops may be grown profitably under the Campbell system has much importance. The greater interest seems to lie in the direction of continued effort to develop water for irrigation, and until the limit of development of water, at a cost which permits its profitable use for farming purposes has been reached, the science of dry farming may properly be left to the semi-arid districts east of the Rocky Mountain range.

In California, perhaps as conspicuously as in any part of the United States, soils of all descriptions respond readily to good treatment and the lesson of careful cultivation may therefore be taken to heart and put to practical use. It is not a secret that cultivation at proper times conserves moisture. The knowledge of this has not, however, caused much improvement in grain farming, nor is it likely to do so while farmers are able to secure large areas and to get in the aggregate from poor farming, fair returns for their labor at the minimum of cost.

A HORSE TRADE.

"Hello!" says I.
"Hello!" says he.
I never see the man afore.
"Swap?" says I.
"Dunno," says he.
"Mebbe. I ain't shore."
"Th' bay?" says I.
"Th' gray?" says he.
"Swap!" says we, an' both unhitched.
"Fine horse," says I.
"Of course," says he.
An' in a minute we had switched.
"Git up!" says I.
"Git up!" says he.
And both them horses stood stock still.
"Balk?" says I.
"Yep," says he.
"Mine, too!" We laughin,' fit to kill.
"Say!" says I.
"Hey?" says he.
"Guess that's a horse apiece," says we.
"Good day," says I.
"Good day," says he.
Best joke, b'gosh, I ever see!

PHILADELPHIA

New York San Francisco Chicago

Malthoid Roofing

Saved the lumber, coal and building plant of A. I. Schowalter & Co., of Halstead, Kan., from fire last March. The south wind blew the flames from a barn filled with hay directly on the sheds of this company. These sheds were roofed with Malthoid, while the sides were covered with corrugated iron. The heat was so intense that it ignited the wood back of the corrugated iron and it was only with difficulty extinguished. The fire-resisting qualities of Malthoid Roofing saved the roof, which was subjected to the most heat.

Malthoid Roofing is fire-resisting and durable.

Live Stock and Dairy

By Mrs. Minna E. Sherman

VALUE OF GREEN FORAGE FOR HOGS.

Corn meal with rape, alfalfa, red clover and blue grass was fed in comparison with corn meal and ship stuff 3:2, and corn meal and skim milk 1:3 in a test made with 6 lots of 6 pigs, weighing about 50 lbs. each. The test covered 102 days and is chronicled in a bulletin of the Missouri Station. The lots were kept in separate pens with a shed for protection and the green forage was given twice daily in a separate trough immediately after cutting.

It was not expected that in ordinary farm practice the green material would be cut and fed to the hogs in this manner. At the time the experiment was undertaken, however, it was not feasible to fence off areas of each of these forage crops and graze them."

"On corn meal and middlings the average daily gain was 0.61 lb. per head, the cost of a pound of gain 3.99 cts., and the grain eaten per pound of gain 4.89 lbs. On corn meal and skim milk the average daily gain was 1.53 lbs. per head, the cost of a pound of gain2.17 cts., and the grain eaten per lb. of gain 1.86 lbs. On the corn meal supplemented by green crops the gain ranged from 0.58 lb. per head on rape to 0.74 lb. on alfalfa. Of these rations, the gain was cheapest on the alfalfa, costing 2.59 cts. per pound, and most expensive on the rape, costing 3.34 cts. per pound. The greatest range in grain per pound of gain was also noted with these lots, being 3.43 lbs. with the alfalfa ration and 4.41 lbs. with the rape ration.

"It is believed to be possible to grow enough alfalfa for hog pasture at least on practically every farm in Missouri. Until, however, alfalfa is an assured success on every farm the farmer ought to arrange for a clover pasture for his hogs every year without fail.

"It is not safe or even desirable to rely upon a single crop, excepting alfalfa where it is an assured success, to furnish pasture for our hogs throughout the entire season. It is better to arrange for a succession of pastures from the beginning of the season until the hogs are ready for market, making the feed richer and more concentrated toward the close of the season and as we approach the finishing or fattening period. For this purpose the following crops are recommended: Red clover or alfalfa, cowpeas, soy beans.

"To provide a crop of cowpeas in the best condition for the hogs, it will be necessary to select some very early maturing sort and sow rather earlier than is advised for a general crop.

"For the best results the hogs should not be turned on the peas until the first pods are turning yellow. They will, however, make good pasture before this time, and if the hogs are needing pasture it is not advised to wait until that stage of maturity.

"As a grain crop to use in connection with corn for crowding the spring crop of pigs to market, the soy bean is a very valuable crop. It is essentially a grain plant, very rich in protein, and while the hogs are running on soy beans they should have access to corn to balance the ration."

The author recommends that medium early corn, which ripens about the same time as soy beans, be fed with them, the two crops being sown together and harvested by the pigs. The pigs should be turned into the field when the first soy bean pods begin to ripen.

"The soy bean is regarded as somewhat better adapted for finishing a bunch of hogs than the cowpea; at the same time if one does not care to bother with so many different crops, the cowpea may be used instead with satisfactory results.

"For brood sows in winter and very early spring, it is always advisable to give them access to a piece of early sown wheat or rye, and to let them have a limited amount of nicely cured clover, alfalfa or cowpea hay by way of variety of feed. Sorghum stalks grown as is customary for the production of sirup, in limited quantity, make an excellent addition to the ration. The main thing to be avoided in carrying hogs of this sort through the winter is a straight corn diet. The greater the variety of cheap materials like these, the better the sows will do."

CHECK-REINS.

In recent years there has been a falling off in the habit of using the check-rein on horses, at least to extremes. People with good taste have come to realize that a horse is more beautiful in its natural state and that high checking will ruin any animal. There are some principles governing the use of the check-rein which everybody who is humane agrees to. Draft horses should have the free use of their heads, unhindered. Driving horses should only be checked when necessary for their proper control. Check-reins cause more stiff shoulders and weak knees than all other causes combined. Colts should not be made to endure the bitting bridle over fifteen minutes at a time. To keep it on half a day, as some do, is to inflict one of the worst punishments possible. Some colts are permanently injured by it.—Journal of Agriculture.

THE HORSE'S FOOT.

In considering the diseases to which horse flesh is heir, there are two things that should always be considered as of special importance: the teeth and the feet. The average period of usefulness of the horse is curtailed several years by the inadequacy of the teeth. In most horses at the age of fifteen the teeth have become rough and uneven, and from that time on the horse is a hard keeper and the real cause is not known by the owner. In buying horses the teeth and the feet should receive most careful examination. Ordinarily, in speaking of the feet of the horse, we mean the part inclosed by the hoof wall. Looking at it from a standpoint of comparative anatomy, the foot includes all below the knee and the hock. The artificial conditions under which the horse is placed and the unusual demand exacted of him result in almost every case in diseased conditions which render him incapable of doing the work he would otherwise do. Shoeing, which places him under artificial conditions, combined with the hard roads, over work, and improper feeding, soon produces inflammatory conditions which may result in side bones, ring bones, cof-

fin-joint, lameness, cracks in the hoof wall, contracted heels, and a great many more diseases too numerous to mention. In many cases the horse must be shod; but there certainly is far too much shoeing done. It is surprising how much work the horse can do under most conditions without shoes, if he be brought gradually to the work, and a little care and judgment be exercised in this matter during the first three or four years of the colt's life. There are three things especially to be remembered if you wish to give this subject a little extra thought: first, as long as you use horses that have weak, defective feet for breeding purposes, just so long will you have horses with a predisposition to these things and you will lose money on them accordingly; second, do less shoeing, a horse with fairly good feet will not need to be shod unless he be worked on the pavement, race track, or in mountainous districts; third, do not allow any horseshoer to use the buttress on the soles of the feet, nor the rasp on the outside; do not leave the shoes on longer than four weeks without resetting.

In substance, remember that the foot is the weakest part of the horse; that the service of the horse is worth money to you. Take good care of the horse's feet!—G. H. Glover, D. V. M., Colorado Agricultural College.

HORSE BREEDING TO TYPE.

Farmers, and others, for that matter, as well, must breed to type. They must know what kind of horses they wish to produce and strive to that end. To do this, they should know what kind of material is at hand, and how it can be used. Here is something that the United States Department of Agriculture should do. And the War Department might also assist, for proper cavalry remounts are difficult to secure. In European countries, where great standing armies are maintained, there are not only governmental breeding farms, but the farmers are encouraged to breed army horses by the giving of prizes, and by permitting government-owned stallions of proper breeding to stand to approved stock at merely nominal fees. In Austria I have seen a whole regiment of cavalry mounted on horses so true to type that it would take study and acquaintance to tell one horse from another. In Germany the government has been breeding for the cavalry since the time of Frederick the Great, and with most satisfactory results. In these continental countries much enterprise is shown in securing the best blood that may be had in other countries, not omitting the Desert of Arabia, whence comes the best and purest equine in all the world. In this matter of horse-breeding the Italians are not the least enterprising, nor, by the way, are the Italians by any means inferior in their horsemanship.—John Gilmer Speed's "About Horse Breeding" in the November Century.

EXERCISING THE BULL.

I saw a good bull the other day which was being spoiled by kindness. He had not been out of his little pen for more than a year, his feet were all out of shape and naturally he was crabbed and surly. Who wouldn't be under such treatment? It is simply inhuman, but it's common. A day or two later I saw another in a well-fenced enclosure, with an overhead wire firmly attached to strong posts, set 40 feet apart at the ends of the pen, and a chain connecting the bull's nose to the wire. Here he traveled day after day, the fence too high for him to see other cattle, but with plenty of room for exercise. The good nature of the animal told of the success of humane treatment. It is not only cruelty to keep a bull closely chained day after day and year after year, but more than that, it will ruin the disposition of an otherwise kind animal. The law of environment holds here, and the bull suffering for exercise cannot be as good a breeder as his neighbor made comfortable in every way. Try it.—Dr. George M. Twitchell in Maine Farmer.

OUR FRIEND THE DOG.

First—Don't leave him without a basin of clean water, renewed each day, or oftener, if necessary. The tortures of thirst should be inflicted on no living creature under our care.

Second—Don't incite him to bad habits of fowl-killing and garbage-hunting by keeping him short of food. The appetites of dogs vary, just as do those of human beings; and what is sufficient for one dog may not be for another.

Third—Don't overfeed him or give him tid-bits at meal times. The former habit is the cause of many distressing complaints and the latter makes him a nuisance when strangers are present and you have no attention to spare for him.

Fourth—Don't blame him if he howls at night if his sleeping quarters are not comfortable; it is not reasonable to expect him to sleep quietly in a kennel improvised out of an old tub or barrel, where his limbs will be cramped and numbed. He should have room to stretch himself and a comfortable rug or straw to keep him warm.

Fifth—Don't condem him to a damp kennel. Rheumatism, or "blotch"—a painful skin disease which is difficult to cure—is likely to be the result if you do.

Sixth—Don't pet him one day and ignore him the next. Dogs are as sensitive as human beings—often more so—and resent injustice every bit as keenly.

Seventh—Don't fail to notice signs of illness when these appear. A dull and "mangy" coat always means something wrong, and prevention is better than cure.

Eight—Don't doctor him yourself, unless you are quite sure what you are about. It will cost you less in the long run to obtain the services of a veterinary at once, and your dog may be spared much suffering.—Globe Democrat.

KEEP CALVES WELL BEDDED.

The stomach of the little calf is very sensitive and is easily ruined. Nothing will do it quicker than keeping the animal confined in a wet, dirty pen. Clean the calf pen often and bed it with a liberal supply of dry straw oftener. It is no little labor to keep a stall where several calves run clean and dry, but there is no other way if you want to raise good calves. Eternal vigilance is the price of everything good in the stock line.

Sheep men of Douglas county, Washington, are rejoicing at the fall rains which have given good grass on the ranges which will last until the colder weather covers it with snow.

THE TALK OF THE
Cream Separator World
The Improved De Laval

"It can't be beaten." "It's peaches and cream." "Nothing like it." "Ten years ahead of all others." "A triumph in separator construction." "Perfect in every feature."

These are but a few of the expressions one hears on every hand this year in praise of the new Improved DE LAVAL Cream Separator. From the Atlantic to the Pacific the Improved DE LAVAL has simply swept the field of all separator honors.

Well informed dairymen once they investigate the new DE LAVAL will have nothing else at any price or under any condition. In one instance 32 Wisconsin dairy farmers were forced to buy hand separators on account of their branch creamery closing down and 31 of them bought DE LAVAL machines, notwithstanding all would-be competing makes of separators were hot after the business. Like instances can be pointed out in almost every section of the country.

The Improved DE LAVAL represents thirty years of manufacturing experience and the expenditure of many thousands of dollars in experimental work. It represents the knowledge gained from nearly a million DE LAVAL machines in practical use by dairymen throughout the world. It represents the best ideas and brain work of the world's most skilled separator and mechanical engineers. It is the product of the largest and finest equipped separator factory in existence.

Surely the 1908 DE LAVAL is ten years ahead of all others. If you havn't bought yours write today for a DE LAVAL catalogue and any desired information.

FAVORITES OF THE POULTRY YARD, Cover.
DRY FARMING, 507.
CITRUS.—Pruning Lemons; Tulare Citrus Fair; Resources Become a Menace, 508, 509.
DECIDUOUS.—Care of a Vineyard; Crown Gall, 510, 511.
ORNAMENTAL GARDEN.—Shade Tree Pruning; Rose Climbers; Water Lily Pond; California Fruits, 512, 513.
LIVE STOCK AND DAIRY.—Value of Green Forage for Hogs; Check Reins; Horse's Foot; Horse Breeding to Type; Exercising the Bull; Our Friend the Dog; Keep Calves Bedded, 514, 515.
EDITORIAL.—Parcels Post; Centralized Agricultural Schools; Big Corn Crop; Tuberculin Test Reliable; Farm Stationery; What Agriculture Needs, 516.
AGRICULTURAL NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast, 517.
POULTRY.—Chicken Chat; Raising Turkeys; Pigeon Breeding House; Hard Crop; San Jose Poultry Show, 518, 519, 520.
STATE FRUIT GROWERS' MEETING, 521.
QUERIES.—Wire Worms; Mildew on Pumpkins; Destroying Stumps; Raisin Stemmer; Green Manuring; Seedless Dates; Calf Shed; Artichokes; Lime Solution on Roses; Failed to Come to Her Milk; Bran for Cows; Peanut Butter; Pruning Malagas; Chestnuts Will Not Keep, 522, 523, 527.
VETERINARY.—Stringhalt; Sheep Poisoned, 527.
LEGAL QUERIES.—Trees on Line, 527.
HOUSEHOLD.—Recessional; Romance of the Desert; A Process in Ouster; Homely Hints; Garbage; Rubbish from the House; How to Carve a Turkey, 524, 525.
PRODUCE MARKETS.—Los Angeles Market; San Francisco Market; Citrus Markets, 526, 527.

PARCELS POST.

Last week's paper was not yet off the press in which we had a short editorial inspired by a letter from a subscriber at Stockton regarding parcels post, when another from our good friend Berwick of Pacific Grove came. Mr. Berwick says that the visit of the Country Life Commission appointed by President Roosevelt gives an opportunity to the farmers which they should avail themselves of. But here are Mr. Berwick's own words in his letter: "Farmers sometimes complain that they cannot make their voices heard in politics, and that their wants are therefore unheeded. Now is their time to talk out in meeting! The 'meeting' will be in Los Angeles this week, Wednesday evening, November 25. The opportunity will be with the President's Commissioners on Farm Life, who are now traveling over the country, especially to ask farmers what their needs are. I am writing this to ask all dwellers in the country to remember parcels post and postal savings banks, and in unanimous chorus to loudly demand both these public boons of inestimable value alike to merchant and farmer."

The Cultivator agrees with Mr. Berwick in the advantage which the postal savings bank might be to the country, but believes that now is the proper time to holler loudest and longest and strongest for the one thing which would be of greater value and that one thing we believe is parcels post. The bank proposition will keep and does not cause the loss and in some cases real suffering which we believe our lack of parcels post does cause. To use an illustration which we have heard Mr. Berwick himself use in various state conventions; where the college boys at the boarding hall for a college yell at the dining-room table united upon "We-want-pie," and as he said when this yell was produced with a vim as it always was the pie was promptly forthcoming. In this case it was secured quicker than had the boys yelled for pie, pudding and cake all at once.

CENTRALIZED AGRICULTURAL SCHOOLS.

A writer in the Spokesman-Review of Spokane, in touching on making farm life more attractive so that young men and women will remain on the farm instead of flocking to the cities, makes a strong point in favor of more attractive country schools with neater surroundings which shall give all possible advantages to the youth of the rural districts. He maintains that lawns and shrubbery, attractive homes, high bred stock, are all strong factors in making the country more attractive. But the longings of the young for better education has more to do with their leaving and acquiring a liking for city life than any other one factor. He urges that many country districts may be centralized into one school which will have all the advantages of the best schools of the city. They should be surrounded by large parks fitted with libraries, auditoriums, gymnasiums and other attractions as good as the best city schools can provide.

He says that as it is at present the farmer is taxed to build fine buildings and maintain a force of instructors at the State University and this taxation is so burdensome that often the poor farmer is compelled to pay taxes for its support and then have no money left for sending his own children. Of course, as a rule this is not strictly true, but may be in some cases. In any case, we believe there is wisdom in the suggestion that more effort be put upon attractive schools and surroundings in the more remote country districts.

BIG CORN CROP.

The Bureau of Statistics in the report dated November 10, states that the crop of corn of the United States this year will aggregate 2,642,687,000 bushels, or about 100,000,000 bushels more than last year. Also about the same amount more than the average for the last five years. Its quality is 86.9 as compared with 82.8 of last year, or as compared with 84.3, the average. The production of winter wheat is likewise in excess of last year, also considerably in excess of the average. The total this year aggregates 425,940,000 bushels. Oats, barley, rye, potatoes, hay, rice, all show greater production than last year, and most of them in excess of the average.

It sometimes looks as if the newspapers were needlessly hollering for returning prosperity but when this report of an enormous crop is considered we believe the country may be reasonably assured that the recent panic is passing away and conditions on the farm and in commercial life will soon resume a normal tone.

TUBERCULIN TEST RELIABLE.

It has been charged that the tuberculin test has at times been made, the reaction showing the animal to have tuberculosis; slaughter afterward proving that there was no disease present. This has often been used by those not in favor of making this test as an argument against it. It has been proved to be true but in such limited degree that it only proves the worth of this test. In a recent address by Dr. Melvin of the Department the following facts were given:

"The accuracy of the tuberculin test has been confirmed in a remarkable way, by post mortem examinations. Out of 23,869 reacting cattle slaughtered, lesions of tuberculosis were found in 23,585, a percentage of 98.91."

FARM STATIONERY.

Of the many letters which come to the Cultivator office, but few are upon printed stationery. This is no reflection by any means upon those who write, because but few farms the country over have ever felt that there was any necessity, or advantage even, in this little extravagance. That there is no necessity the Cultivator grants, but we do believe that there is or may be an advantage in neatly printed farm stationery. Some have written to the Cultivator office on stationery of the very highest grade with the name of the home and its owner embossed, which makes far more expensive stationery than the business house often uses. Such expensive stationery is demanded by those of expensive tastes and the means to gratify them. And it must be confessed it attracts attention in a way which has a certain value to the farm, especially to one which markets its own products and is endeavoring to build up a reputation for a brand. But at least the ordinary printed stationery on good stock has an appearance which cannot help but give the ranch a place in the estimation of the reader of the letter which the scrap of paper often used in correspondence does not give.

WHAT AGRICULTURE NEEDS.

Agriculture must rise to meet the college man. The leading agricultural colleges are now so well established and are teaching in such direct and applicable ways, that they are creating a body of ability and sentiment touching country life that has never been known before. This ability and sentiment is bound to express itself. The influence of these colleges and experiment-stations will surely remake agriculture and redirect it.

This redirection will not show itself in increasing the productiveness of the earth only, although this must be the fundamental effort and result. It must consist as well in reorganizing the business or commercial interests of agriculture, and in a radical change in the ideals and modes of living. We shall be able to increase the profitableness of farming when we have learned to apply our science, and to organize it as part of good business systems. We are now in the epoch of the laudation of science itself, as if the mere knowledge of the laws underlying good crop and animal production can make a good farmer.—Prof. L. H. Bailey's "College Men as Farm Managers" in the November Century.

The condition of the corn crop on October 1 was 77.8, as compared with 79.4 last month, 78.0 on October 1, 1907, and 79.7 the ten-year average on October 1. The decline in condition during September was thus about 2 per cent., compared with a decline in September last year of 2.7 per cent., and an average decline in September of the past ten years of 1.6 per cent.

Farming at the present time is entirely different from what characterized the farming of our forefathers. Brawn is no longer at a premium on the farm. It is skill in the art and science of the farm that wins instead of hard labor. Of course the farm will always demand labor from the farmer, but it is the labor from the skilled hand directed by the trained mind that will best succeed. —James Withycombe, Oregon Agricultural College.

Shop Talk

RENEWALS—12-08—If these are the figures after your name on the address label of your paper, it is a pretty good indication that your subscription to the Cultivator will expire December 1, 1908. It means that you should take advantage of the clubbing offer as advertised last week and have the figures changed to 12-09, with but little or no charge, or in some cases even at a profit, including the Cultivator.

If you have destroyed last week's issue, write for our special clubbing list, as it will not appear in the paper again.

It is a wonderful opportunity to obtain the best magazines at greatly reduced prices. Look it up. Do it now.

CHANGES OF ADDRESS—Many requests to change address of the Cultivator are received which fail to give the old address to which the paper has been sent. Our lists are indexed according to postoffice and it is next to impossible to find a subscriber's name in it without knowing at what office it is received. Kindly bear this in mind when making such requests, so as to avoid the necessity of our writing for the information.

WICKSON'S CALIFORNIA FRUITS—We have a correction to announce in the price of California Fruits as advertised in our clubbing list last week. The rate as quoted there with a year's subscription to the Cultivator was $3.75, but we are now able to announce that the price will be $3.50 instead. The regular price of the book alone is $3.00, which is the amount to remit when not including a subscription to the Cultivator. It is now ready and orders can be promptly filled.

Agricultural Notes of the Pacific Coast

Northern California

Threshing of the rice crops at Biggs, Colusa county, is under way.

Alfalfa seed threshing in Lassen county has been quite extensive during the past season.

The State Health Office is after some stock men for selling veal under four weeks of age.

Dairy men at Ukiah, Mendocino county, have been introducing some high grade dairy stock.

Contractors in charge of the repair work on the levees near Yuba City are finishing their contracts.

A Placer county orange grower shipped 1500 boxes of oranges to Australia on October 23.

Quite extensive plantings of Bartlett pears will be made in Sutter county the coming season.

Coyotes are proving a serious nuisance to poultry and sheep men near Weaverville, Trinity county.

A large tract of land in Sutter county near Terra Buena, is being divided into 10 acre orcherds.

W. A. Beard of Sacramento has been appointed a member of the Country Life Commission by President Roosevelt.

Arrangements have been made for a State Fair Futurity Stakes of $5000 for trotting and pacing two and three-year-olds.

The present indication is that hay will advance very materially, some predicting that it will be higher than ever before.

The Ukiah cannery has had good demand for its output of canned fruits, all of which were grown in Ukiah valley.

The California Pigeon Club will hold its third annual exhibition of fancy, utility and homing pigeons at Oakland December 10-13.

Petaluma poultry men are planning for a big show of poultry to be held December 16-19. A special list of prizes has been arranged.

A Cultivator representative now working at Orland reports a small orchard of oranges in that section which are remarkably well colored.

Work is progressing on the big irrigation project west of Orland which the government is constructing at a cost of nearly three-quarters of a million dollars.

Experts with the Farmers' Demonstration Train which visited Arbuckle, Colusa county, discovered that many of the old vineyards of that section are infested with Phylloxera.

The California Creamery Operators' Association has decided to inaugurate a movement to induce the United States Department of Agriculture to assist in forming cow testing associations.

The Sacramento Valley Development Association has just forwarded an exhibit of products of that valley to Omaha, Nebraska, where it will be installed at the Pure Food Exposition which began on November 4.

State Engineer Ellery has conferred with property owners along the Mokelumne River on the proposition of making the river navigable on condition the property owners put up $6000 to match an equal amount put up by the state.

Central California

A dairyman at Los Banos, Merced county, was seriously if not fatally injured by a pet bull.

The opening of a 10,00 acre tract in Kings county is drawing many settlers to that rich land.

The fifth annual flower show of the Menlo Park Horticultural Society was recently held at Palo Alto.

Large quantities of Egyptian corn will be planted on the California alfalfa colony, Stanislaus county.

The Kerman Melon Growers' Association has been re-organized and is planning to ship July cantaloupes.

Exeter people are arranging for football, baseball, and other games to take place in the coming citrus fair.

The California Fruit Canneries Company says that everything points to a great demand for California fruit next season.

It is claimed that over half a million sacks of beans have been harvested this season on the delta lands of the San Joaquin river.

Those who have observed the prune market and know of the stock in hand say prices are sure to advance in the near future.

Tulare county grape growers are endeavoring to get together under the guidance of the California Grape Growers' Association.

Grape growers of Turlock recently held a meeting to consider the possibility of securing better returns from their next year's crop.

Exeter packing houses are busy places these days, and the Sun of that city says that the town is full of nice looking "packing ladies."

San Jose claims to be some on pumpkins, having recently sent two to the State Board of Trade at San Francisco, weighing 161 and 164 pounds.

The Woman's Club of Bakersfield is discussing the advisability of offering prizes for the best home garden which may be shown in that section.

The recent Farmers' Institute at Rosedale was given large attendance and interesting talks were made by local people as well as by talent from abroad.

Seed growers of the Santa Clara valley say that the seed industry of this state is yet in its infancy and in time will be one of our greatest industries.

Grape growers of Lodi who sold their lower grade grapes to the unfermented grape juice factory will receive from $10 to $12 per ton for their grapes instead of the $6 which the wineries offered.

Tulare Grange at a recent meeting resolved that the Board of Supervisors of that county should take immediate steps to preserve the large oak trees in the delta lands of the Kaweah River. They ask that a hundred acres be preserved as a natural park.

Democrats of Tulare county, which has always been Democratic until recently, claim that the change to a strong Republican majority in the county is due to the fact that Secretary Miot of the Tulare County Chamber of Commerce has done all his promotion work in northern states rather than Texas and Mississippi.

Southern California

Orange county reports almost a million orange trees and 110,000 lemon trees.

One train load of 550 head of cattle was recently received by the Imperial Valley farmers.

Orange county has 35,685 acres irrigated by gravity system and 51,670 acres irrigated by pumping plants.

Up to the first of this month Commissioner Pease of San Bernardino had treated 23,437 citrus trees for scale.

Owing to the large orange crop, tree props are already being placed under many Southern California trees.

Several creeks of Southern California have been stocked with trout by the State Fish and Game Commission.

Horticultural Commissioner Pease of San Bernardino county reports that Yucaipe valley will produce over 1200 tons of apples.

Southern California farmers are bitterly complaining of the drought which it is hoped will soon be broken by heavy rains.

The Ventura county output of beans this year will aggregate 825,000 bags. This is the largest output the county has ever shown.

Imperial Valley turkey growers are somewhat disappointed over prices received; f. o. b. Imperial being about 15 cents a pound.

The estimates for the coming crop of oranges for Southern California hover close to the 30,000 mark. Some put it as high as 31,000 car loads.

The Redlands Golden Orange Association is preparing for greater business by building an extensive addition to its already large packing house.

The Lytle Creek Water Company has added to its supply of water and will be able to supply lands under its system with an increased water supply.

The Pacific Fruit Exchange, owner of the great pre-cooling plant at Colton, is pushing work on the house which will be 270 by 180 feet and 35 feet high.

A meat packing house is in contemplation to be somewhere between the national boundary line between the United States and Mexico in the Imperial Valley.

Stock holders of the Water Company Number One in Imperial Valley are discussing the advisability of acquiring the California Development irrigating plant so that the property owners of Imperial valley may own and control it entirely.

The Riverside Groves and Water Company recently organized and capitalized at $250,000 announces that it will take over 80,000 acres of land on which 700 inches of water will be piped and the land may be afterwards planted to oranges.

Orange county Board of Horticultural Commissioners have reported to State Commissioner Jeffrey that Scutellista cyanea have greatly decreased the black scale, in fact almost exterminated it. The report also showed that red scale is somewhat increasing and calls for a more energetic campaign against it.

The Coast

Rentals for farming land near Walla Walla, range from $4 to $25 per acre.

Wenatchee, Washington, poultry fanciers are planning for a big show in January.

The Tacoma, Washington, Poultry Association holds its annual show December 5-10.

The dairy industry of Oregon has increased about $5,000,000 every year for the past five years.

The Payette Poultry and Pet Stock Association holds its annual show December 16-19 at Payette, Idaho.

A fruit cannery will be established at Albany, Oregon, and ready for handling fruits the coming season.

Spokane is about to establish a free market to which the farmers may drive and dispose of their produce.

Creston, Washington, recently held an apple show at which there was a showing of remarkably fine fruit.

Over 2,000,000 bushels of wheat were shipped from Portland, Oregon, during the month of October by water.

The best display of apples ever made in the upper Willamette valley was that at the recent Albany apple fair.

A farmer near Montesanto, Washington, is proud of his record this year of a yield of 61 bushels of wheat per acre.

Farmers near Canyon City, Oregon, especially stockmen, are facing a serious range shortage on account of drouth.

Walla Walla, Washington, farmers are making the most extensive planting of fall wheat which they have made in several years.

Grain growers at Athena, Oregon, are protesting at the recent advance in freight rates. They claim the rate to tide water is almost prohibitive.

The first prize to the county making the best exhibit of agricultural products at the recent Albany Fair was awarded to Marion county, Oregon.

At a recent fair at Walla Walla, a monster parade was made and speeches given in honor of "Farmers' Day," which was a new feature at the fair.

A Lewiston, Idaho, cattle raiser predicts that cattle raising of that section will soon be a thing of the past and that hog raising will take its place.

The National Apple Show which will be held in Spokane December 7-12 is attracting attention from all parts of the country. Some big cash prizes and many gold medals are to be given.

Farmers at Wenatchee ,Washington, who have been exasperated by the depredations of coyotes have decided upon a raid or drive to round up as many of the pests as possible. It is estimated that a thousand people will be on the firing line when the signal to start is given.

George Severance, Professor of Agriculture of the Washington State College, is out with a strong protest against the present custom of dumping numberless tons of stable manure into creeks and gullies as has been done in the Palouse country. He says it is nothing more nor less than a crime against the commonwealth that so much fertility is wasted.

PER 2 BUSHEL SACK **$1.90** PER 2 BUSHEL SACK

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used those machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Egg-More

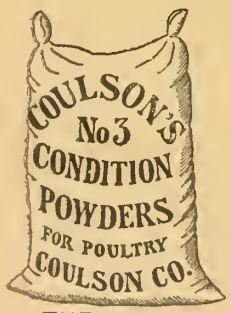
is not a strong tonic and stimulant, but, a highly nitrogenous, concentrated Poultry Food, very rich in protein. A little fed with good grains will keep hens healthy and make them lay lots of eggs. Have you tried it? Many have and are pleased. Here is just one:

F. W. Healy, the well-known banker and fancier of Pasadena, writes: "After hearing others praise Egg-More, I determined that if there was anything to keep hens laying through the fall and winter months, I wanted it. I bought a package of Egg-More and fed it and the improvement was very marked. Keeping on with it I soon proved the truth of your statement that 'you can't put all your eggs in one basket if you feed Egg-More.' I have raised poultry nearly all my life and for twenty years in California, but never did my hens lay so well as since I began to use Egg-More. I consider it the best egg producer on the market, and I do not intend to be without it."

You better try it. For sale by many dealers at 12½ lbs $1.00; 25 lbs., $1.90; 50 lbs., $3.60. If not by yours we will prepay freight on sack within 400 miles.

West Coast Mill

707-709 So. Griffin Ave., Los Angeles, Cal.



Coulson's No. 3 Condition Powder

THE BEST AID IN GETTING THOSE HIGH-PRICED EGGS.
It acts as a tonic and digestive. Enables hens to lay more eggs during fall and winter.
Our FREE booklet, "THE RIGHT WAY," gives full particulars.
SOLD BY DEALERS EVERYWHERE.
Manufactured only by

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

CHICKEN CHAT.

TO have unexpected company walk in at the front door between ten and eleven o'clock in the morning, while the spring chicken you intend to fry for their dinner, (which, on account of the school children, must be served at noon) is still scratching in the back yard in happy unconsciousness of its impending fate, calls for quick movements; and my method of dressing a chicken quickly may help some other housekeeper in a like dilemma.

"Why have a chicken at all?" Some one asks.

Well, I had been bragging to these people about the excellent taste and flavor of my beloved "Buckeyes," and had promised them a fried one when they came to see me, and it wasn't their fault that the letter they sent me didn't reach me until noon that day, so it was "up to me" to make good my word.

Showing them into the "spare room" to remove their wraps, I started the gasoline stove and put a kettle of water on to boil. Then beguiling them into the orchard, I left them to help themselves to fruit off the trees, while I whisked the head off a saucy cockerel with a cleaver, and left him to flop while I got the water. Assuring myself that he was dead, I scalded him thoroughly, grasped him by both feet and while I was going back of the barn, pulled off the tail feathers, and wingflights on the way. Keeping these in my hand, I caught the bird by the neck, and quickly rubbed him from head to tail with the bunch of feathers in all directions, front, back and sides, being careful to rub the way the feathers grow, never against them. This removes all pinfeathers, and a few quick motions frees the neck, after which I take a wing at a time between the thumb and forefingers and pinch out the feathers the way they grow in these. It really is done much quicker than I can write it.

Then the bird is singed, and the carcass well washed in warm water, using soap, if necessary, to get it perfectly clean before cutting up. Laying a newspaper upon the table or sink board saves the necessity of washing up after jointing the fowl, as all offal can be gathered up with the paper and either burned or put out where the cat can pick it over.

By the time my guests had returned from the orchard, the chicken was simmering on the stove, and I had time to prepare my vegetables and visit by spells, and serve dinner at half past twelve, after all.

But the very nicest way to cook chicken for company, or for Sunday dinner when you want to attend church, is the following, which was invented by a bachelor, I understand.

For a young fowl, allow two hours, for an old one four, to begin with, so in case an old one is used, prepare and partly cook on Saturday, or at least get it ready for the oven on Saturday.

In using an old fowl, soap and warm water are absolutely necessary to get it clean, of course thoroughly washing the soapy water off afterwards. A hen never takes a bath, you know, and the skin certainly does get a sight of dirt upon it in a year or two, which only a thorough washing will remove. If carefully done there will be no scum arise to speak of, so let that be the test of thorough work.

After the fowl is jointed, prepare a covered baking dish, or roaster, by melting a tablespoon of butter, and letting it run over the bottom. Then roll each piece of chicken in flour, and lay in the dish, sprinkling salt and pepper over each layer, and adding sufficient water to cover, being careful to pour the water in one end and not wash the flour off the pieces.

Cover closely and put into the oven, and arrange for a steady, gentle heat, and go about your business serene in the consciousness, that your chicken will be cooking, and the gravy made in the required time, without any further attention excepting the fire. Too much heat will sometimes dry up the gravy, in which case water, or better still, cream, may be added just before serving, allowing it to heat well, of course. Sometimes, I have made a batter as for dumplings, and poured over the top a half hour before serving, which makes a delicious chicken pie of it, but my menfolks object to chicken pie, on the ground that it is "such a lottery, one never knows what piece one is getting, when covered with crust." And it does take up the gravy shamefully.

And as chicken is never complete in my mind without "cabbage and cream" I will give you "Aunt Nancy's" receipe for this salad. Chop your cabbage fine and season with salt, a little sugar, and pepper, then shut your eyes, and dip several tablespoons full of your thickest cream onto the cabbage (I say, shut your eyes, but I mean your economy) and add sufficient vinegar to make it just right, stir until it foams, and you have a salad to tempt an epicure, and it just fits right with the chicken.—Mrs. Frank Metcalf.

RAISING TURKEYS

Great deal has been written in regard to turkey raising in California. Many insist that they cannot be raised in large numbers unless they have free and unlimited range. We recently had the pleasure of a visit to the Stuhr-Williams Poultry Co., at Riverside, and found a flock of over 200 as fine Bronze Turkeys as we ever saw. This flock has the range of 14 acres, 10 of which is alfalfa and four in oranges. The combination, orange grove and alfalfa, makes an ideal place for turkey culture. The alfalfa furnishes the green and the orange orchard furnishes shade.

This firm certainly has been successful with their stock as all were healthy and vigorous. To see such a flock will make anyone feel that they would like to engage in turkey culture.

As soon as the young rooster begins to crow, you should either feed him to the threshing gang or sell him in the market catalogued as the "old rooster" variety. Rooster flocks should be constantly culled and those which do not meet the standard from a breed standpoint should be promptly disposed of in some way. From the roosters our flocks develop and by constant weeding out the flock gradually improves in standard.

PIGEON BREEDING HOUSE.

For a breeding pen it is not necessary to build a house for this especial purpose. If you have an old poultry house, shed or barn loft or an attic, which is available, it can be remodeled at a slight expense and used until such time as your flock has increased so greatly as to necessitate the building of a new house. In this way you get a start in the business without any big expenditure, which is usually necessary when new buildings must be erected.

It is best to have the breeding pens have a somewhat southernly front, but if you are unable to arrange the house in this respect for some reason or other, you need not get anxious, as an eastern front is considered almost as good as a southern front by many breeders of squabs. We would advise you to try and not have your flying pens face the direct north or northwest in an open country, but if your houses are well protected in these directions very little harm will result.

The main points in the construction of your breeding pens are that they should be as nearly rat and damp proof as possible and arranged so as to get the benefit of the sun, which means that it is best that the houses face east or south.

For a rat and a damp proof house it is best to select a high and dry place for your building. You should also have a double floor made of a lower layer of hard pine. Spread two thicknesses of tar-paper over this and finish up with matched lumber about one inch thick, or to doubly protect your house from either rodent or dampness, you can have a layer of asphalt or cement under the floor. A floor of this kind will last a life time. The roof may be shingled, or you can use three-ply tar paper with just as good effect as shingles, but care should be taken to give the roof drain.

The sides of the house may be built of plain matched lumber and clapboard or shingled with a layer which will act as a protection against dampness and frost coming through the walls. At the present price of lumber a house of this sort would be quite expensive and for those who cannot meet this expense, I will say that tar paper will replace clapboards or shingling well enough, but you should see to it that all seams are covered with tar or pitch to avoid the cold air getting in between the tar-paper and the siding.—Melrose Squab Bulletin.

HARD CROP.

Overfeeding is generally responsible for hard crop, says a writer in Journal of Agriculture. Irregularity of meals, dried grass or straw, sudden change of feed, constipation, lack of green food and stoppage of entrance to gizzard are also frequently responsible for it. To empty crop, give hen a tablespoonful of olive oil and place her where she has only water. If reduced within twenty-four hours, follow with a teaspoonful of oil, and when empty give two five-grain capsules of Venetian red. If a failure, take a funnel, insert down past opening of windpipe and fill crop slowly with water, having care not to smother hen. Then turn hen with head down, slowly knead crop, but be careful that contents do not gush out too fast and see that hen has chance to breathe, or she may smother. This filling and gradually reducing contents is often a success and may be used for soft crop if simply turning hen with head down does not work.

The dry, prepared animal foods, such as beef scraps and animal or meat meals, if of good quality, are cheaper and safer feeds than cut fresh meat and bone and can be so used as to produce an equal egg yield.

Pioneer Rubber Sanded Roofing

The Roof that "proves," sun-proof and rain-proof; needs no paint or repairs. Following are a few "Wont's" about Rubber Sanded Roofing:

Won't chip. Won't warp.
Won't tear. Won't crack.
Won't rust. Won't decay.
Won't shrink.
Won't crumble.
Won't need repairing.
Won't absorb moisture.
Won't attract electricity.
Won't need any paint to preserve it.
Won't be affected by any climatic changes or conditions.
Won't cost as much, in the long run, as other roofing.

What Rubber Sanded WILL do is told of in our booklet "ROOF TALK," which will be sent free upon request, together with samples of the Roofing itself.

Trap Nested White Leghorns

I trap nest every bird one year before I put them in my breeding yards, and no bird that has not made a record of 13 dozen or better per year as pullet is used. I cannot afford to breed neither can I afford to sell eggs from a hen that has not made this record as a pullet. I mate 15 hens to a well matured cockerel or yearling cock bird. My breeders have roomy yards, thus assuring strong fertility. A few choice cockerels for sale.

Eggs $1.50 per 15; $7.50 per 100; $60 per 1000.

SAN JOSE POULTRY SHOW.

The Poultry Show which recently closed at San Jose was held under the auspices of the Santa Clara Valley Poultry and Pet Stock Association and was by long odds the most successful show ever held by that organization. Nearly every class was full and President Sealy and Secretary Harper both express satisfaction at the success of the show. Eastern judges were present and complimented the class of the birds, saying some of the very finest birds they had ever judged were on exhibition.

The Dog Show in connection was one of the finest ever held on the coast.

The awards in the poultry class are as follows:

Dark Brahmas.—William A. French, all awards.

Light Brahmas.—J. Russel, 1 pen and 2 cock, 3 hen; Mrs. Emma Reid, 1, and 3 pullet, 3 pen, 3 cock, 3 cockerel; V. E. Smith 2 pen, 1 hen, 2 pullet; W. R. Struther, 1 and 2 cockerel and 2 hen.

Rose Comb Rhode Island Reds.—Manuel Roberts, all awards.

Barred Minorcas.—August Schwarz, all awards.

Rose Comb Black Minorcas.—Dr. C. N. Chamberlain, all awards.

White Minorcas.—H. C. Scrutton, 1 and 2 pullet, 1, 2 and 3 hen, 1, 2 cockerel, 2 and 3 cock, 1 pen; Dr. C. W. Chamberlain, 3 cockerel.

S. C. Brown Leghorn.—Walter Curry, all awards.

Buff Leghorns.—Manuel Roberts, all awards.

Columbian Wyandottes.—George Leaman, 1, 2 and 3 pen, 1, 2 and 3 cock, 3 cockerel, 3 pullet, 1, 2 hen; C. G. Hinds, 1 and 2 pullet, 1 and 2 cockerel, 3 hen.

Buff Wyandottes.—Henry Berrar, all awards.

S. C. Black Minorcas.—J. M. Nelson, all awards.

Barred Rocks.—Moore & Mann, 1, 2 and 3 cockerel, 1, 2 and 3 hen, 1, 3 cock, 1, 2 and 3 pen; L. N. Cobledick, 2 cock.

Golden-Pencil Hamburgs.—Rev. W. E. Crouser, all awards.

Silver-Spangled Hamburgs.—Rev. W. E. Crouser, all awards.

White Plymouth Rocks.—Mrs. D. A. Robertson of San Jose, 3 pullet, 1 and 2 hen, 2 and 3 cockerel, 3 cock, 2 and 3 pen; Mrs. F. E. Bemis, 1 and 2 pullet, 3 hen, 1 and 2 cock, 1 pen.

Silver-Laced Wyandottes.—Jas. Mitchell, all awards.

Silver-Penciled Wyandottes.—Mrs. George Grindell all awards.

White Wyandottes.—Mrs. C. D. Hubbard, 2 and 3 cock, 1 cockerel, 1 hen, 1 cock, 1 and 2 pullet; Mrs. Clara Smith, 3 cockerel, 2 pen; Mrs. Buergemeister, 2 cockerel; Lewis & McKean, 1 pen.

Rhode Island Reds.—J. D. Canney, 1 pullet, 3 hen, 3 cockerel, 1 and 3 cock, 1 pen; Sanitary Poultry Farm, 1 and 2 hen; W. R. Alexander, 2 pullet, 2 cockerel; F. H. Thompson of San Jose, 3 pullet, 1 cockerel, 2 cock, 2 and 3 pen.

Black Langshan—J. A. Johnson, all awards.

W. F. Black Polish.—Mrs. D. A. Robertson, all awards.

Buff Orpingtons.—W. S. Sullivan, all awards.

S. C. Black Orpingtons.—J. D. Canney, 1 pen; Henry Berrar, 2 pen, 1 and 2 cock, 1, 2 and 3 cockerel, 1 hen, 1, 2 and 3 pullet; V. G. Huntley, 3 cock, 2 hen; A. J. Welch, 3 hen.

S. C. White Orpingtons.— W. R. Bassick, all awards.

S. C. White Leghorns.—Rancho Los Encinas, 1 pen; C. B. Carrington, 2 pen, 2 and 3 cock, 2 cockerel, 3 hen, 1 and 3 pullet; F. E. Baldwin, 3 pen, 1 cock, 1 and 3 cockerel, 1 and 2 hen; Lewis & McKean, 2 pullet.

Cornish Indians.—Alex Aikeman, 1 pen, 1 and 2 cock, 1, 2 and 3 cockerel, 1, 2 and 3 hen, 1, 2 and 3 pullet; William K. Krieg, 3 cock.

Houdans.—Mrs. Emma F. Reid, 1 and 2 pen, 1 cockerel, 3 hen, 1 pullet; Henry Midgley, 3 cockerel, 3 pullet; Carl Gregory, 2 cockerel, 1 and 2 hen, 2 pullet.

Bronze Turkeys.—Herbert Stockton, 1 cock, 2 hen; Rancho Los Encinas, 2 cock, 1 hen.

White Holland Turkeys.—Mrs. W. C. Bogen, all awards.

Pekin Ducks.—John A. Evans, 1 drake, 1 duck; Rancho Los Encinas, 2 drake, 2 duck.

Aylesbury Ducks.—H. C. Scrutton, 1 old drake, 3 young drake, 2 old duck, 2 young duck; V. G. Huntley, 2 and 3 old drake, 1 and 2 young drake, 1 and 3 old duck, 1 and 3 young duck.

State Fruit Growers' Meet

Commissioner Jeffrey has sent to us his announcement for the convention to be held at Sacramento Dec. 1-4. From it we quote:

The subjects to be discussed at this meeting will be of more than ordinary interest to the fruit growers of the state. In view of the fact that there is to be a tariff revision early next year, every fruit grower should awake to this matter. The market questions concerning the disposition of many fruits should be thoroughly discussed, and the fact that the state insectary is to be dedicated at this meeting will lend added interest to the convention. Besides these, there will be many subjects of paramount interest to be considered.

The subject of noxious weeds is one of burning interest over a large portion of the state, and it is hoped to bring this subject to the attention of the fruit growers in time to prevent the spread of some of these new pests in other territories, and to recommend legislation regarding their control.

Another topic of great interest is the threatened invasion of the thrips, a small creature that has already rendered abortive hundreds of acres of deciduous fruits, and is now infecting some of the citrus territory. Dr. Howard and his associates will have papers on this subject. The fitting of the soils to the crops will be discussed by a government expert, and one of the chiefs of the Forestry Service will speak upon the protection of our water sheds, together with the State Forester. A special feature will be Northern California walnut growing, papers being presented by both a scientific man and a practical grower.

Judge Peter J. Shields will address the convention upon a subject relating to farm life that is being considered by the whole nation.

The convention will also consider at one session the horticultural laws of the state. It is expected that the committee appointed one year ago will have its report ready, and recommendations embodied leading to the revision of the horticultural laws of the state. One meeting will be devoted entirely to the consideration of county horticultural commission matters. There will be papers on the apple and other fruits; a paper on the tariff, and special prominence will be given in another session to the grape-shipping business. The Chambers of Commerce of Stockton and Lodi have united in presenting the topic of the Tokay grape in a valuable paper to be prepared by a writer chosen by these associations.

The number of papers will be fewer this year than ever before, owing to the general demand of the growers for more time for discussions at these conventions. In view of this fact, every fruit grower is invited to come to this convention prepared to present any ideas he may have for the betterment of the industry, and we hope to have ample time for this part of the work.

The usual low railroad rates will be available. It will be necessary in purchasing your ticket at your home office to secure a receipt for the same and present it to the secretary at the convention for his signature; you can then secure one-third fare on the return trip, making a one and one-third fare for the round trip.

California Promotion Committee

CALIFORNIA PROMOTION COMMITTEE.

The Counties Committee of the California Promotion Committee at its recent meeting in Los Angeles discussed from all sides the subject of the tourist in California. The question was not only handled from a general standpoint but each section had its own representative who gave papers touching upon the attractions of their section from a tourist standpoint. Sacramento valley, San Joaquin valley, the coast counties and Southern California, all were spoken of in the very highest terms.

Mr. Frank Miller of Riverside maintained that the one great factor in attractiveness which should be made more of in this state is the historical or sentimental side. That is, he said, much as we need good hotels, advertisements of them were of secondary importance compared with historical features such as the old missions which are most attractive to all comers from the East. Many people consider these attractions lacking in California, but from his standpoint we have sufficient of them if we made of them as much as possible. These, with our wonderful scenery, should be sufficient to attract our portion of the travel which now goes to European countries if we only advertised them properly. We are today receiving less than two per cent of the travel of the tourists of this country, the great bulk of it going to Europe.

The one factor which attracted most attention and livened up the meeting more than any other was the resolution introduced urging the establishment of a government line of steamers from Pacific coast points to the Panama railway, to connect at the eastern terminus with a government line to New York. This was warmly supported by Isidore Jacobs of San Francisco and opposed by Mr. Pierce and others from the northern end of the state. As a rule, southern people favored it and those from the north opposed it. In voting upon the question a division of the house was called for: 34 voted to table the resolution, 25 against tabling.

Walla Walla, Washington, hay buyers are taking in large quantities of timothy hay, hoping to secure government contracts which call for delivery of 9000 tons.

Wire-worms.

I have a letter and specimens from Santa Barbara asking how to rid the soil of wire worms.

This is a difficult question to answer, and anything that I can say will, I fear, prove unsatisfactory.

Wire worms are the larvae of click beetles. They are probably as hard to exterminate as any of our known pests. Various remedies have been tried with varying degrees of success and failure—(principally failure). Probably the best remedies are gas lime and carbon bisulphide.

The killing property of gas lime soon passes away, so it must be used fresh to be of any avail, and it must be used in large quantities (say 20 to 40 tons per acre), and then it is only partially successful.

Carbon bisulphide may be used in a limited space by making holes in the ground with a picket pin 14 inches apart and pouring an ounce of the liquid in each hole and covering immediately with earth. Care must be taken not to let the liquid touch the roots of any growing plant, as it will surely kill the plant.

The ground may also be sterilized by means of hot water pipes laid underground and close enough together to heat all of the earth.

A dozen or fifteen other methods have been tried, but the effective ones are prohibitive by reason of expense. —S. A. Pease.

Wire-worms.

"Will you give me advice as to the best treatment for getting rid of wire-worms? One bed in the greenhouse is alive with them. They destroy nearly every plant I have planted. As the location is very hot I had to mulch the ground in order to keep the soil cool."—J. R., Santa Barbara.

These wireworms are the pest of every gardener's life and the hardest to handle of any which he has to deal with. They are the larvae of the click-beetle, a worm like creature with a very hard covering, usually brownish or yellow white. There is scarcely a cultivated plant they do not attack. Continually spading and breaking up the ground especially in the dry season when it can be allowed to dry out and harden is the best remedy. This of course compels you to lose the use of the ground for a year or more. Some have endeavored to treat them with bisulphide of carbon but this is not entirely satisfactory. Fertilizing the soil with nitrate of soda and other mineral fertilizers is to a certain extent helpful but the only really effective way is the starvation plan of letting the ground go fallow.

See also Mr. Pease's reply to a Santa Barbara subscriber asking same question.

Mildew on Pumpkins.

A subscriber whose name we have mislaid inquired as to pumpkin vines which ceased to grow and half grown pumpkins would not ripen. They were covered with a whitish substance similar to mildew.

The letter was referred to Prof. Ralph E. Smith of the Pathological Laboratory and he writes:

Your correspondent's question in regard to pumpkin vines is scarcely definite enough to warrant a reply. It may be, however, that the vines are affected by the pumpkin mildew, which is not uncommon on this crop. This mildew appears as a white, frosty growth upon the leaves, similar to the mildew of the rose, grape and many other plants. These troubles are most apt to occur during moist weather, particularly when the difference in temperature between night and day is great.

The pumpkin mildew is not usually considered very serious or destructive enough to warrant any treatment. Other troubles of the same sort, however, are commonly controlled by the use of sulphur dusted on the leaves when they are wet with dew. If this seems worth while and the trouble is the one which I have described, your correspondent might try it.

Destroying Stumps.

Can you tell me of any acid mixture which will kill out stumps?—C. C. & M. E., Lemoore.

We do not know of any acid solution, but some have claimed that by boring large holes in the tops of stumps and filling with saltpeter, if done as soon as the tree is cut, the saltpeter is absorbed through all the stump and makes it far more combustible so that by the time it is dry setting fire to it consumes it to the very tips of the roots. Others say that by filling holes bored in the tops of seasoned stumps with coal oil the entire stump is saturated so that it readily burns out. If any subscriber has experience, will he kindly inform our Lemoore subscriber?

Raisin Stemmer.

Kindly let me know if there are any stemmers of raisins on the market for small quantities. I have about 500 pounds Thompson Seedless which I would like to stem.—Subscriber, Chico.

We do not believe there is any stemmer which could be had which would pay to buy for small lots of raisins like this.

Green Manuring.

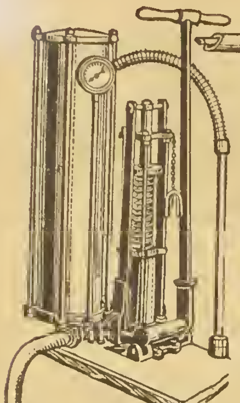
I had wished to plant vetch for green manuring this fall, but as the rains have held off and it is now so late I have thought of putting in barley for hay, and after taking off the hay irrigating and planting vetch. In case that would be best, when should that vetch be turned under?—F. G., Greenfield.

If you have water at this time to irrigate with, we imagine you could do well still in growing vetch this season, as it grows very well during the cold season, better, in fact, than the field peas. You do not say what you wish to prepare the land for ultimately, or when you wish to have it ready for the planting. If you should plant the barley now and then plant a spring crop for green manuring, we think you would find better results from planting cow peas. They are a better summer grower than the vetch. You must bear in mind, however, that any summer crop for green manuring will require an immense amount of water. If you have sufficient water to wet the ground before plowing you could plow at any time when the plants have reached sufficient bulk to make a heavy covering of the ground. If not, then it would be necessary to wait until the rains come to enable you to do the plowing.

Seedless Dates.

I have a three-year-old date palm which has two large bunches of dates. These dates are of fine flavor, but seedless. Is a date without seed common?—W. B. Richards, Holtville.

The Corning Irrigation Company will send a representative to Washington in the endeavor to prevail upon the Reclamation Service to assist in securing water for lands in Tehama county.



See That Patent spring?

It means much to the fruit grower who realizes the need for effective spraying, but deplores the ordinary pump with its exhausting labor, its unsatisfactory spray and its continual clogging and bother. This spring is found only in

Bean Magic Spray Pumps

It would be found in others, but the Bean Patents prevent it. This spring divides the work, permitting the operator to do half the work at each stroke of the handle. And he works against but half the pressure indicated on the gauge. It saves just one-third the labor. Two sizes of Bean Magic pumps; both have Bean patent spring, non-clogging ball valves, and other exclusive features.

Our illustrated catalog No. 21 describes ten sizes of hand pumps, and contains much valuable spray information, and formulas. Catalog No. 22 describes Power Sprayers. Both books sent free. Write for our special offer; state number of acres and kind of fruit.

We are not sufficiently informed on date culture, but take it this is a freak in the date family. It is possible it is a very valuable one. At least, we would give it every possible attention and care to secure its perfect growth.

Calf Shed.

Is it necessary for a calf to be under shelter these nights, or is it best to leave in corral? Some think the nights too cool for the calf to be out. —A. L. H., San Bernardino.

We have seen farmers who felt that the "hardening process" of short feed and exposure to the elements was a good thing for young stock. But without question the more successful farmers believe in protecting youngsters from storm and from the night chill. You must bear in mind that the heat given off by stock exposed to weather can only be made up by extra feed. If feed is of value, it is worth while to protect the stock. In addition, we believe healthier, quicker growing stock will be given to you if given a reasonable degree of protection. This does not mean they are to be pampered and kept unduly warm in a close house.

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a **HUMAN REMEDY** for **Rheumatism, Sprains, Sore Throat,** etc., it is invaluable.

Every bottle of **Caustic Balsam** sold is Warranted to give satisfaction. Price **$1.50** per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE LAWRENCE-WILLIAMS COMPANY, Cleveland, Ohio.

FARMERS' BOOKS

Order Through the Cultivator

THE BOOK OF ALFALFA.—By F. D. Coburn. Most thorough treatment of this most important subject by its leading authority. The book is printed on fine paper and illustrated with many full page photographs that were taken with the especial view of their relation to the text. 336 pages, bound in cloth, with gold stamping.
Price..... ....$2.00

FEEDS AND FEEDING.—By Prof. W. A. Henry. Is a thorough, accurate and reliable handbook for students and stockman, giving most practical and useful knowledge on plant growth and animal nutrition, feeding stuffs, feeding animals and every detail pertaining to this important subject, indispensable to every owner of live stock. 653 pages. 6x9 inches.
Cloth $2.00

AMERICAN GRAPE GROWING AND WINE MAKING.—By George Hussmann of California. With contributions from well known grape growers, giving wide range of experience. The author of this book is a recognized authority on the subject. Illustrated. 269 pages. 5x7 inches.
Cloth $1.50

STANDARD OF PERFECTION.—By the American Poultry Association and used as the standard for judging all shows. The thing for dealers in fancy stock.
Cloth $1.50

PERFECTED POULTRY OF AMERICA.—This is the most recent publication, and is one of the finest poultry books ever issued. ..... $2.50

THE NEW AGRICULTURE.—By F. Byard Collins. A new and authoritative work dealing with the changing agricultural conditions. Why "Back to the Soil" is calling millions from the cities to the farm. The debt which agriculture owes to science. Irrigation, fertilization, machinery, etc. Illustrated, 374 pages, cloth.....$2.00

Cultivator Publishing Company

Artichokes.

Kindly inform me concerning the care of artichokes (Alcachofa), and whether they can be raised on a small scale for family use in this section?—F. H. P., Pomona.

We take it you mean the globe artichoke, Cynara scolymux, or the plant which yields its flower buds for our consumption. This plant will thrive on any well prepared garden soil; even on the heavier adobe it has been known to do well if cultivated so as to retain moisture. It is benefited by heavy manuring. The plant grows from seed, which are usually started in boxes in the fall, or where dependence is placed upon the rain, as soon as heavy rains come. The seedlings may then be transplanted to their permanent location in the garden. Or if you have old plants they may be subdivided and the suckers removed and used for new plantings. The plants will bear and do well, if given good care, for many years. In field culture the rows are usually 4 or 5 feet apart and plants 3 feet apart in the rows. Gather the buds for use before the well formed scales open. If you should mean the Jerusalem artichoke, plant and treat the same as you would potatoes.

Lime Solution on Roses.

Some time ago I saw an article under the head "The Ornamental Garden," on the tendency of rose buds to blight at this season meaning insects at the roots. It said to dissolve a peck of fresh lime in a barrel of water and give the ground a good soaking with the solution, using only the clear water on top. But it did not say how often to repeat. Will you please inform me how often? My roses bud, but won't open, just die.—A. B. N., Gardena.

Two applications at intervals of 4 or 5 days will be sufficient.—Q. A. L.

Failed to "Come to Her Milk."

My cow was fresh middle of September, but her milk did not come for two weeks, and she gives only half what she should. She gets all she wants to eat. We give her the best alfalfa and pumpkins, which are salt so she'll drink, but she drinks very little. What can we give her to start the flow of milk?—New Subscriber, Chino.

The time to start the milk flow is within ten days of calving. The only thing I could suggest would be to chop up some alfalfa hay and pile it up well wet, turning it two or three times to be sure it is wet all through, then cover it up and let it heat. Feed it at the rate of twenty pounds a day in two feeds. I would not try to force the cow to take salt except you do it by giving her it in a soft slop of bran. Cows have their off years, sometimes, and the cow may come out all right next year. Whenever a cow's milk does not come within forty-eight hours after she freshens it is time to do something, as there is usually fever. Most of these cases are from incomplete cleaning.—M. E. S.

Bran for Cows.

My cows run on green alfalfa, also have all the alfalfa hay they can eat, and have free access to a straw rack. I would like to ask you if it would pay to feed them grain or bran, and how much per cow a day?—C. L. J.

I should not advise buying other feeds, as the grains are out of sight in price. The ordinary dairyman cannot uusually afford to buy mill feeds when they go above $15 a ton. If you had some corn, the cows would give more milk. Better plan to grow it next year for fodder. In a few years you will have it in a silo—corn silage with alfalfa hay makes more butter than anything that can be grown at the price.—M. E. S.

Peanut Butter.

In the issue of the Cultivator of Nov. 19, I notice a request signed "F. K. H.," for information regarding the manufacture of peanut butter, and as I was formerly in the wholesale confectionery business and have made a great deal of this preparation, I gladly give "F. K. H." the benefit of my experience.

Peanut butter is made by grinding blanched roasted peanuts as fine as desired. An ordinary food chopper will do it satisfactorily if they are put through it several times.

After they are thoroughly ground, some preparation of a "fatty" or oily nature should be mixed with them to make them into a paste. This should be something that has a melting point of about 70 degrees Fahrenheit in order that it will not congeal in cool weather. I usually used a preparation called "Nut Lard," or another one called "Konut." Both of these are made from cocoanut oil and do not grow rancid either with age or warm weather. Any confectioner's supply company handles them. Cocoa butter is very satisfactory but is more expensive.

Hoping this information will be of some use to the inquirer and expressing my appreciation of your very valuable paper, I am very truly yours.—T. E. Wilson, Ceres.

Pruning Malagas.

What course shall I pursue in pruning Malaga vines planted this last March on adobe soil, surface irrigated. Grapes are intended for table use, so would have to be free of the sticky soil. My intention is to cut away all but one cane, leaving that one 26 inches long and tying to a four-foot stake standing 30 inches above ground. Tied-up cane to remain permanently. Also please state if you can recommend a book on pruning table grapes. —R. W., Lindsay.

We know of nothing on pruning better than Prof. Wickson's book on California fruits. You are simply pruning your Malagas in the regular way. We all prune them to the half high crown—20 to 24 inches for the upright cane, cutting above a good bud. Next season cut back to one or two buds on each spur coming from this first bud, and after five years the stakes can be removed and the vines will stand up all right. It is doubtful if you can tie up all the vines this season. We then prune them back and during July or August stake up the leader without pruning it. Better run one deep furrow for irrigation two or three feet from the vines—it is cheaper, and the vines will send their roots down better.—M. E. S.

Chestnuts Will Not Keep.

I am a grower of chestnuts, but

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.
The only lamp on the market that is sold under an absolute guarantee.
Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.
Here are a few of The Angle Lamp Merits:
NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.
GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.
The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Household Department

RECESSIONAL.

Composed at the Queen's Jubilee and Naval Review, 1897.

God of our Fathers, known of old,
Lord of our far-flung battle line,
Beneath Whose awful Hand we hold
Dominion over palm and pine—
Lord, God of Hosts, be with us yet,
Lest we forget—lest we forget!

The tumult and the shouting dies;
The captains and the kings depart;
Still stands Thine ancient Sacrifice,
An humble and a contrite heart.
Lord God of Hosts, be with us yet,
Lest we forget—lest we forget!

Far-called, our navies melt away;
On dune and headland sinks the fire;
Lo! All our pomp of yesterday
Is one with Nineveh and Tyre!
Judge of the Nations, spare us yet,
Lest we forget—lest we forget!

If, drunk with sight of power we loose
Wild tongues that have not Thee in awe,
Such boasting as the Gentiles use,
Or lesser breeds without the Law—
Lord, God of Hosts, be with us yet,
Lest we forget—lest we forget!

For heathen heart that puts her trust
In reeking tube and iron shard;
All valiant dust that builds on dust,
And guarding, calls not Thee to guard;
For frantic boast and foolish word—
Thy mercy on Thy People, Lord!

—Rudyard Kipling.

ROMANCE OF THE DESERT.

OLE Swanson and Miss Tillie Hanson, both of Imperial county, came diffidently into the office of O. R. W. Robinson, Receiver of the Land Office, yesterday, says a report in a Los Angeles Daily paper. Ole was smiling, Miss Hanson blushing.

"Way ban wan' gat married." said Swanson.

"No objections," replied Mr. Robinson, "but you're at the wrong place. This is the United States Land Office. You want to see the County Clerk at the court house.

"Ay know," replied Swanson, "but my gal. she tal me we have to see Uncle Sam fairst and mak sure on land.".

Miss Hanson quit blushing, and at once proved that in their household she won't be simply Mr. Swanson's wife, but that he will be Mrs. Swanson's husband.

"We have," she told Mr. Robinson, "homestead claims next each other in Imperial valley. Both together, we take up a whole section. Now Mr. Swanson he ask will I marry him. I say yes. But before I do so I want to know if, when we make final entry, both of us can take the land we file on—yes or not?"

Mr. Robinson looked up the law. It said plainly not. He told Miss Hanson so.

"Then Ole," she said, turning toward her sturdy pioneer beau, "we will wait four years until we both have homesteads for keeps. Then we will have this big farm anyhow.

But Mr. Swanson was at that fervid stage of love which ill brooks delay.

He turned appealingly to Receiver Robinson.

"Ain't there ban no way to gat them lands togather?" he inquired.

"None," said Mr. Robinson. "I am sorry I can't oblige you, but the law is strict on that point. You can't get an extra half section by marrying the claimant."

Here Mr. Swanson asserted himself.

"Dan," he announced, "Ay'll tak' 160 acre and may gal."

He gathered Miss Hanson in his big, long arms. She didn't resist.

"We gat married. Those other 160 acres bay hang!"

And Swanson winked and grinned at the receiver as he backed out of the door, his sweetheart still close in his hearty embrace.

A PROCESS IN OUSTER.

WHEN the Thortons moved into their new home, Mr. Willis Thorton, the young man of the family, took great satisfaction in the sole possession of a big hall closet. He had never before had ample accommodations for the proper putting away of his belongings, and it was a real pleasure for him to be able to arrange his coat hangers and trousers stretchers in neat, uncrowded rows, says "Youth's Companion."

"Willis," said his younger sister one morning, shortly after they were settled in the new home, "Mme. Brazee sent my new visiting gown home yesterday, and I havn't got my wardrobe in very good order yet, so if you don't mind I'll just hang the dress up in your closet. You have such lots of room."

"All right, sis. I guess I can spare you a hook."

It was somewhat of a surprise to Willis when he opened his closet that evening to find not only the new gown, but a voluminous party cloak hanging there. Thinking that the demands upon the hospitality of his closet would be temporary only, he made no comment, even when a few days later he observed that his handsome spring overcoat had been hung on the same hook with his old raincoat to make room for a most feminine-looking riding-habit. But the evening that he discovered all his clothes crowded into the small end of the closet and the rest of the space occupied by two fluffy dancing frocks, a tennis skirt, golf suit, walking dress and several outdoor wraps, even his easy-going spirit rebelled.

He carefully took down all these articles and laid them on the chairs in his room, and re-arranged his own apparel once more in its original order in his own closet.

The next night at dinner his sister said, severely, "I've just seen, Willis, how you've treated my clothes. If you do such a thing as that again I just won't let you hang any of your things in that closet."

HOMELY HINTS.

If you will, get one ounce of oil of sassafras, and then use it every time you scratch or cut yourself. Apply it four or five times a day. It will also relieve the soreness of cankers which come in the mouth if applied from four to six times the first day you feel them. Don't forget to try it.

We note the following in an exchange which may be good if it does not injure the clothes. It looks like a labor saver.

The following is an excellent washing fluid: One can of lye, 5 cents worth salts of tartar, 5 cents worth powdered ammonia. Place an iron pot or earthen vessel upon the stove and put a quart of water into it, then put in the ammonia and salts of tartar. When they have dissolved fill the vessel to contain two gallons, then add the can of lye. After all the in-

gredients are thoroughly dissolved pour mixture into a jug and set in some unused place where no one will use it by accident. Assort your clothes on the day previous to washing them, place them in tubs or boilers, where they are to be soaked. Heat sufficient water to cover the clothes and add one-half cup of the fluid to each five gallons of water, also soap enough to make a good suds. Pour this over the clothes, cover with pieces of carpet or any thick material to keep the steam in. Next morning put enough warm water into the tubs so the water will not seem cold to the hands. Rinse the clothes, boil in water prepared as before, stirring occasionally, rinse blue and hang out to dry. You will find your clothes clean without rubbing. The fluid is so cheap any one may have it.

GARBAGE.

In what matters is there a special demand for this neatness? On the farm there is the garbage, the rubbish or waste matter from the house and the general litter scattered about the grounds. The barnyard needs attention to prevent the all too prevalent helter-skelter disposition of the farming machinery and implements. Then neatness calls for prompt and efficient repairs on our farm buildings and their appurtenances.

With regard to garbage, which is offal or refuse matter from the kitchen, on the real farm the most of it is of service for the pigs or for the poultry. Yet there must be some place where it can be kept until it is wanted for such use. A pail or garbage can may serve for this temporary storage. Of course these receptacles should be emptied frequently. The pail or the can should be kept outside of the house and should preferably be placed in a box or some light covered structure built for the purpose. This should be convenient to the kitchen door and should be sightly in appearance. Such an arrangement removes all temptation to cast the garbage about the yard. It provides a sanitary and convenient method of disposing of the offal. Then it tends to do away with an important source of ugliness in our surroundings.

RUBBISH FROM THE HOUSE.

Rubbish or waste matter from the house such as empty tin cans, broken dishes, old boots and shoes, ashes and the like are much more troublesome sources of annoyance than garbage. How common a sight it is to see discarded boots and shoes lying about the dooryard, or to see ashes piled up here and there or spread about on the drives and walks in a purposeless manner. The tin cans and broken dishes, if they have gotten beyond the back door step, are probably reposing by the side of the highway, making known our untidiness to all the passer-by. How bad this all is! How inconvenient! How ugly! How fundamentally wrong!

There should be a temporary receptacle for our ashes. There should be another for the cans, the broken dishes and the cast-off garments. These should be convenient, neat in appearance and inconspicuously placed. From time to time their contents should be removed. The final resting place for this rubbish should be selected with care. It ought to be in some out of the way place where it is not likely to intrude upon the surroundings. Very often it happens that there is some hole that requires filling. This is the very spot for our rubbish. If there is no place of this nature, it is really worth while to make an excavation in some out-of-the-way corner and reserve it for the burial of waste matter. By all means keep yourself from depositing it by the side of the highway. If you are shameless in this respect or take delight in vaunting your own slovenliness, please consider the rights of others. The public has a right to a neat and attractive highway. This right you are bound to respect.

HOW TO CARVE A TURKEY.

Not a bone of the bird should be scratched by the knife or touched by the fork. I shall take off the joints, slice the breast and cut out the oyster pieces, and the carving-knife will not so much as rub against a bone.

I place the turkey on one side, and secure the leg and second joint with my fork. With one stroke I put the knife beneath it in such a position that when I raise the fork the path of the knife will clear the joint completely from the bird and separate the ligaments, with the bone showing firm and appearing without a blemish. I put it on the edge of the platter, and later I will divide it without any difficulty at all. Look at this second joint. There is not a bit of flesh left on the bird that should have come off in the carving.

The next move is toward the wing. I get a good hold on that with the fork, then with the knife placed carefully beneath it I lift the fork slowly and firmly, while the knife does its work well.

The taking off of the joints I consider the most important part of the carving. A carver can spoil a dinner by not knowing his business. He can make everybody feel uncomfortable and sorry they came; or he can take away their appetite by letting the bird flop in a greasy trail half over the platter or seem perilously near landing in the guest of honor's lap.

Now I am ready to slice the breast. I lay the turkey on its back and put the fork in, so. Then above the wing I cut through the thickness of the breast so when I slice it the pieces fall off abruptly. I cut them very thin and remove all the meat with the utmost care. When it is all done it is arranged about the platter so the matter of giving each guest what he or she fancies is a most simple one.

Here I have come to the real test of every carver. It is time to remove the oyster piece. You will see it is whole and comes out with one stroke of the knife, leaving the bone without a fragment of covering and with nothing to show a knife has been near the surface. The other side, of course, gets the same sort of treatment, and the bird is stripped.—New Idea Woman's Magazine.

ASKING TOO MUCH.

I believe there's a story told of Mark Twain that in youthful days, being sent out by his mother to weed a certain flower bed, and finding more weeds than flowers, he came back in and asked if he might not "flower the weed bed."

Our little Alfred probably has as great an aversion to work as had the youthful Clemens. Admonished to pull some rather large weeds in the back yard, after a faint-hearted lift on one of them, he shouted:

"Mama, how do you think I'm going to pull these weeds when the whole world is hitched onto them?"—November Woman's Home Companion.

Mayer

WORK SHOES

Tough stock, heavy soles, solid counters, double leather toes, double seams and high-grade workmanship are what make Mayer Work Shoes last longer than any other kind.

Farmers, miners, lumbermen, mechanics and all classes of workmen can get double the wear out of

The HOPKINS & ALLEN "Three-Shot" Gun

is unequalled for quick shooting. The three shots, one in the gun and two in the clip, can be fired with the rapidity of a repeater. No more missing good shots because your ammunition isn't with your gun. There are always two shells in the clip. No need of keeping a loaded gun in the house—a shell is slipped into the breech at a second's notice. Your gun is always ready for a shot at hawk or game, and you don't have to hunt for shells while the game gets away.

You were never offered a gun as good as this for the price.

Fine decarbonized steel barrels bored full choke for close shooting and deep penetration. Frame case-hardened. Stock and fore-end fine walnut. Top snap action, locks automatically, and joint takes up its own wear. Rebounding hammer, rests in safety notch after firing, eliminating danger of accidental discharge. Hard rubber butt plate. This gun is guaranteed to shoot factory-loaded nitro powder shells. 30 or 32 inch barrels. Automatic ejectors.

1908 GUN GUIDE, FREE!

Our Gun Guide and Catalog for 1908 describes in full 11 styles of double guns, 8 styles of singles, 10 styles of rifles and innumerable kinds of revolvers. Gives lowest prices and offers most complete line. No sportsman or gun lover should be without it. Write for it now.

Hay.

Shipments of hay to market continue to increase, the total for the week amounting to 3750 ton in comparison with 3570 last week and with 2210 ton for the week preceding that. There is somewhat of a tendency on the part of many operators to withhold their shipments anticipating still higher prices but as the car situation is easier, many back orders for hay shipments are now being filled which has resulted in the increase in arrivals. Many consumers are still impressed with the advisability of putting away a good supply of hay so all arrivals have been absorbed very readily.

Many sheep in the flocks of sheep owners near Colusa have been poisoned by eating of acorns under trees in the pasture. The sheep began dying soon after being turned into the pasture and the cause could not be determined for some time. It was finally found to be caused by the acorns.

Citrus Market

Oranges are going forward slowly as yet. Tulare and Butte counties are carrying the bulk of the shipments. Southern California is shipping approximately 4 to 6 cars per day. Tulare county about 25 to 35 per day and Butte county 4 to 8 per day.

Shipments.

Total shipments from Southern California to date this season since Nov. 1.59 oranges, 258 lemons. To same date last season 217 oranges, 281 lemons.

Northern points, 551 cars of which 31 were lemons.

NEW YORK, Nov. 23.—One car Valencias, eight cars lemons and two cars nevels sold. One car Mexican oranges also sold. Market steady on Valencias and lemons. The market is very steady on fancy grade lemons but easier and lower on ordinary grades. Weather mild; heavy fog.

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Queries

Continued from Page 523.

fail to keep the kernel of the nut from decaying—that is, after picking same. I do not spray with any mixture, but have tried drying, both in ovens and by the sun—both prove failures. Please give me a remedy, if any.—B. B. C., Vacaville.

Try spraying your trees with Bordeaux mixture in the late winter and when you gather the nuts dip them in a solution of formaldehyde, one ounce to about 5 gallons of water, then dip in clear water and dry. This last dip is not necessary, but removes any doubt as to any formaldehyde remaining on the nuts.—J. W. M.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Please address all questions that are to receive gratuitous replies through these columns to California Cultivator, 115½ N. Broadway.

All communications to Dr. Whittlesey direct should contain a great big dollar.

Stringhalt.

I have a fine large horse which has a "catch" on one hind leg when starting to walk. Some people call it "stringhalt." Is there any relief or cure for such trouble? Please reply in your magazine.—Subscriber, Brawley.

There is an operation, cutting out a section of the peroneal tendon, which is usually successful in curing the stringhalt. But you will have to have a man who knows how to perform the operation.—R. T. W.

Sheep Poisoned.

I have pastured 1,000 sheep on barley stubble for a week; then changed to another barley stubble field, and next morning found a good many with very loose bowels. When they commenced to die they did not bloat. What is the cause and remedy, if any? —E. H. H., Holtville.

There are many things that might make your sheep have loose bowels, but barley stubble alone never would. There is something you have overlooked. I think you had better call on your county veterinarian, Dr. Douchy, and have him look the matter over thoroughly.—R. T. W.

We note in recent Northern California papers that bands of sheep turned into fields where many oak trees are which have dropped many acorns have often died from eating the acorns. We presume this is not the case with the enquiry above, but it may indicate the many ways the sheep man has to look to protect his stock.—Ed.

Legal Queries

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

TREES ON LINE.

There was a row of trees near the line between a neighbor and me. He supposed they were on his land, and he cut them down and made stove wood out of them, about four years ago. We had the land surveyed last month and the line ran so as to leave the trunks of the trees on my land about four feet. Now can I get anything back or not?

You have a right of action against him for the value of the trees severed from the land, and a right of action also for damages for the loss sustained by the removal of the trees, the value of the trees as they stood. You might avail yourself of one or the other of these rights.

Of course, you should have used reasonable diligence to ascertain your rights, and it may be that your claim is outlawed, but that is another question.—Edw. L. Payne.

AN ENTERPRISING SEED COMPANY—THE SEED HOUSE OF THE GREAT SOUTHWEST.

We have before us the 1909 seed catalogue of the Aggeler and Musser Seed Company, who have heretofore been doing business under the name of Johnson and Musser Seed Company. Although E. A. Aggeler became a member of the firm soon after Mr. Johnson's death in 1903, the name had not been changed until a recent meeting of the stockholders.

The catalogue is the most complete manual, of seeds, plants, nursery stock, a special eucalyptus department with complete cultural instructions, also a comprehensive catalogue of Petaluma incubator and poultry supplies, ever published on this Coast.

But the greatest attention is given to the ranch and garden seeds, as this house has made a specialty of seeds for field crops and vegetables peculiarly adapted to the climatic conditions of the great Southwest, both on the Coast and in the interior valleys, as the conditions of each place require different varieties of crops for each season of the year.

Some of the great leaders that originated in Southern California and were discovered and introduced by this house are the three best watermelons in the world, shown on page fifty in natural colors: the Oregon evergreen sweet corn that excluded all other varieties from this market: the Anaheim chile pepper, now the most famous in the world: The Hybrid casaba, the best of the seven most popular casabas pictured in natural colors on the cover page; also on the front page cover is painted in natural color and size the largest lima bean in the world and more than twice as productive as any other lima bean yet propagated. It is undoubtedly a world beater.

The business will continue under the capable management of H. L. Musser, who has been at the head of the company for the past twelve years. By keeping in close touch with the great Los Angeles produce market, and also with the market gardeners and ranchers throughout the Southwest, he has gained the reputation of being the most thorough seedsman on the Coast.

Forty-five thousand of these catalogues will be mailed before the twentieth of December. If you have not received yours by that time, be sure to write for it. The address is 113-115 N. Main street, Los Angeles.

THE AMERICAN SQUADRON ABROAD.

The departure of the United States fleet on a world-wide cruise to the nations of the earth was an occasion of no small importance to our country. No such errand was ever undertaken by any nation before in the history of the world.

This act may justly be regarded as a master stroke of diplomacy.

One curious incident has recently come to our notice by the receipt of a photograph from far-away New Zealand. It pictures Admiral Sperry, commanding the American squadron, upon his arrival at Auckland. There, amid the throng gathered to do him honor, he stands receiving this British dependency's welcome under a roof covered with Genasco Ready Roofing, that great American product, made by the Barber Asphalt Paving Company, Philadelphia. It reminds us that the world is not so large, after all, when we can travel to the antipodes and there find our old home friends—tested and true.

NOT AFFECTED BY DEPRESSION.

When a manufacturing establishment reaches out in a year of depression and increases and expands its business, while others in the same line diminish their outputs or stand still, it is because there must be some unusually good reason for it. In this instance a splendid reputation and a more-than-ordinary meritorious product were responsible for the showing made.

The Mayer Boot and Shoe Company, Milwaukee, the largest shoe establishment in the Northwest, has just closed its fiscal year and reports an increase in sales over the corresponding period of last year. This exceptional showing speaks volumes for the genuine merit of Mayer shoes, and is directly attributable to their high standard, and because of the fact that Mayer shoes have become universally and popularly known as "shoes of quality."

Most of our readers, no doubt, have become familiar with the shoe advertisements of this enterprising firm, that have been appearing in the columns of this publication for a number of years past. To those who have not yet become familiar with the extraordinary wearing qualities of Mayer shoes, we would recommend a closer acquaintance by a purchase of a pair at the first occasion.

The leading brands are "Honorbilt" fine shoes for men. "Leading Lady" fine shoes for women. "Yerma" cushion shoes for both men and women (these are exceptionally fine shoes for people troubled with tender feet;) the popular "Martha Washington" comfort shoes, which have the largest sale of any shoes of their kind in the world, and the "Special Merit" school shoes (a strong and sturdy line of seamless school shoes that wear like iron.) In addition to these brands, the Mayer Boot and Shoe Company make a complete line of every-day and Sunday shoes for all purposes. In fact, there is a Mayer shoe for every purpose and for every member of the family.

A CHICKEN FOR HIM.

Once upon a time a youth who had commenced to navigate the sea of matrimony went to his father and said, "Father, who should be boss? I or my wife?" Then the old man smiled and said:

"Here are 100 chickens and a team of horses. Hitch up the horses, load the chickens into the wagon and wherever you find a man and his wife dwelling stop and make inquiry as to who is the boss. Wherever you find a woman running things leave a chicken. If you come to a place where the man is in control, give him one of the horses."

After 79 chickens had been disposed of he came to a house and made the usual inquiry.

"I'm boss o' this ranch," said the man.

"Got to show me."

So the wife was called and she affirmed her husband's assertion.

"Take whichever horse you want," was the boy's reply.

So the husband replied, "I'll take the bay."

But the wife didn't like the bay horse and she called her husband aside and talked to him. He returned and said, "I believe I'll take the gray horse."

"Not much," said Missouri, "you'll take a chicken."—Philadelphia Ledger.

Louisiana rice men visiting the Butte county rice growers have refused to unqualifiedly indorse the methods of culture in that section. They think that thus far too much water has been used.

The Requirements of Date Culture

Read Before the State Fruit Growers at Riverside

By SILAS C. MASON, Arboriculturist
Plant Life History Investigations, Department of Agriculture

DATE growing is doubtless one of the oldest of horticultural industries, its culture by the Egyptians 2000 years B. C. being well authenticated by tablets and hieroglyphics, and by the Assyrians at a period much more remote. Assyrian wall tablets, long misunderstood, are now recognized as showing the pollination of the date tree as an important ceremonial. And, indeed, it may well have been so regarded, for as the blighting of the corn tassels by the hot prairie winds of Western Kansas or Oklahoma means the failure of the corn crop, so any failure in the critical process of artificially pollinating the date flowers, with male flowers from separate and perhaps distant trees, may mean the loss of their only food crop to thousands of people of the desert regions. Few people who purchase dates as a confection realize that they are one of the world's staple food crops, and the timber afforded by the date palm trunks the main dependence of large numbers of people, in the erection of their rude dwellings and villages.

Few trees in cultivation are so peculiar in their requirements, or so restricted as to the area of their profitable productiveness. Like most woody plants of cultivation the date varieties are not reproduced true from seed. Unlike our common exogenous fruits, as, for example, the Navel Orange, or the Bellflower Apple where a single twig may afford buds from which twenty new plants true to the variety may be propagated, the date tree has, except in rare instances, no branches but only the terminal bud putting forth the enormous compound leaves, and a limited number of suckers or offshoots from the base of the trunk. These offshoots constitute the only means of propagating the variety and as they should be three or four years old before removed from the parent tree and their production ceases by the time the tree is 15 or 20 years old we see how slow and expensive a matter it is to get a date garden established and that the danger of a rush into the date growing industry and consequent over-production is not great.

Climate.

In climatic requirements the date demands great heat, long sustained, and a dryness of atmosphere found only in almost rainless regions. A clear distinction must be drawn between localities where the date tree may be grown as an ornamental and those where the fruit may be successfully grown and ripened.

In Southern Florida, along the Gulf of Mexico and along the Pacific coast from San Francisco southward the winter temperatures are sufficiently mild and the summer heat great enough to permit the growing of beautiful specimens of the date tree, yet the summer temperature is not high enough and the humidity too great to permit the development of the fruit.

Only regions of such extreme heat and dryness as are found in the Sahara, the Persian Gulf countries or the Valley of the Euphrates of the Old World, have proved successful date producing territory. Careful botanists have computed that the zero point of the date tree, as far as flowering and fruiting is concerned, is 18 degrees, Centigrade, or 64.4 degrees, F., and Dr. W. T. Swingle, in Bulletin No. 53, U. S. Dept. of Agriculture, has shown that where the excess over this in mean daily temperature added together for the growing period of from May 1st to October 31st approximates 1500 degrees to 2000 degrees, with the requisite sunshine and dryness of atmosphere, early varieties of dates may be ripened.

With an excess amounting to from 2800 to 3300 degrees for this period, as at Cairo, Egypt, and Biskra, in Northern Sahara, date culture becomes a standard industry, numerous varieties of medium earliness and quality being produced in commercial quantities. At Phoenix, Arizona, an excellent example of a similar climate, seedling dates, many of them of very fair quality have ripened for many years.

With 3800 to 4200 heat units for the growing season in the hotter Sahara Oases and at Bagdad, the choicest long season varieties of dates, such as the Deglet Noor, Menakher and Kustawi are produced, fruits sold as delicacies rather than staples, and commanding such retail prices as our choicest candies and bon bons. Analogous climatic conditions and high number of heat units characterize the Coachella and Imperial Valleys of Southern California, where we may yet expect to see these fruits produced in quantities to satisfy our entire demand.

Dr. W. T. Swingle regards the area in the United States where date culture is a possibility as comprising the hot interior valleys of Central California, the Salton Basin, the valley of the Colorado to the Nevada line, a small portion of the Mohave Valley and Death Valley, the lower Salt and Gila River Valleys and a small area of the lower Rio Grande Valley in Texas. In the cooler portions of this territory only the early quick maturing sorts could be expected to succeed, while in the hotter portions of the lower Colorado Valley and the Salton Basin it has been demonstrated that many of the varieties requiring the longest season may be successfully matured.

But though at home in the fiercest heat in which any vegetation grows the date palm endures a greater degree of cold than the orange, possibly about the same as the olive, a fact probably due to the tough, fibrous nature of the leaves and tissues and the protected position of its single terminal bud. There are a number of date palms about Indio that are known to have survived a minimum of 15 degrees, F., with little, if any, injury and old seedling trees are growing in the neighborhood of Phoenix and Tempe, in Arizona, where a minimum of 12 and 13 degrees have been recorded during their history.

From the heat requirements of the date palm it is natural to conclude that it is also a drouth resistant plant, but it is not more so than the Washingtonia or desert fan palm of Southern California which while a native of the hottest canyons and washes surrounding the Salton Basin delights to grow with its roots in a snow fed streamlet which may sink into the sands a mile further out, but lacking this will be found where there is a slow seepage and permanent moisture, though this may be of too salty or alkaline a character for the traveler's use.

Like the fan palm, the date palm must have an assured supply of moisture in order to exist and a genorous supply if fruit is to be perfected. Its root system closely resembles that of the Washingtonia as it develops in a few years' time a powerful system of round cord-like roots of great penetrating power and able to reach considerable depths for a water supply. Seedling date trees near Indio which have had no irrigation for a year and a half have continued to make good growth, bore fruit last year. These are along the line of a heavy mesquite growth and it is known that surface wells are obtained at a depth of from fifteen to twenty feet. It is only reasonable to suppose that the date roots have penetrated to layers of permanent moisture.

The nature of the soil will have much to do with the water supply demanded by a date plantation, the very sandy soil at the Mecca garden requiring much more frequent irrigation than soils of a clay or adobe nature. The well provided for this 10 acre tract is an artesian well bored about 500 feet deep and with a 3½ inch casing, inside diameter. The flow is approximately 150 gallons per minute, or 216,000 gallons per day of 24 hours. This is equivalent to 12½ miner's inches, as usually reckoned. It has seldom been necessary to operate the well for more than the 8 hour day, even during the greatest summer heat, but as the trees develop in size the demand will be greater. Dr. Swingle quotes French authority for the daily need of date trees in Northern Sahara as from 126 to 180 gallons per tree per day, at the source of supply, but with a considerable loss calculated for seepage and evaporation.

A report from Mr. E. F. Chumard, in charge of a plantation of Deglot Noor date trees, on heavy adobe land near Heber, in the Imperial Valley, indicates that he uses approximately 126 gallons a tree daily during the growing season of six months, May to October, inclusive, applied direct to the orchard without allowance for seepage or loss..

With the water distributed in pipes, or tile or cement conduits, as in the orange groves of Riverside county, a great saving in the requirement per tree is effected.

Soil Requirements.

That dates may be grown upon a great variety of soils has been fully demonstrated in this country, as well as in their home, but we still have to gain much experience as to soil adaptations of different varieties.

At the Tempe garden growth of all varieties upon the brown adobe soil of the Salt River bottoms is very rank and luxuriant, and the production of fruit all that could be expected. It is evident, however, that the ripening of the fruit is a good deal retarded by moisture which the soil retains and it seems evident that many varieties of fruit are of a more soft sirupy nature grown here than in the dry hot sands at Mecca.

A situation where the drainage is bad and irrigation or flood waters not readily removed should be avoided. With the heavier soils it is very important that baking and cracking should be prevented by prompt cultivation as soon as the ground can be worked after irrigation. In short, good drainage and aeration of the soil are an essential to the date as to ordinary crops.

Alkali Resistance of Date Palms.

The alkali resistance of the date is very remarkable, it ranking as the most resistant plant in cultivation, even exceeding the Australian Salt Bush. Old well-established trees are able to endure a much greater strength of alkali than young seedlings. The old trees may seem to be much more resistant than they really are from the fact that alkali accumulations on the upper layer of soil, which is usually turned by the plow, may become very heavy with little injury if the roots can penetrate to sub-soils having a comparatively

THE LEMON INDUSTRY.

By G. Harold Powell, Pomologist In Charge of Fruit Transportation and Storage Investigations, Bureau of Plant Industry, In The Yearbook.

THE American lemon industry has become permanently established on a firm foundation within the last few years, the seasons since 1904 having proved unusually profitable. It commenced to assume a commercial aspect twenty-five years ago, but for a score of years it was a question whether it would become established permanently or whether the American supply of lemons would continue to be derived, as in the past, from foreign sources.

The lemon is grown in the citrus-fruit belt of California, where at the present time the annual production is from 3000 to 4000 carloads, which represent approximately 100,000,000 pounds, or from one-third to two-fifths of the total quantity used in the United States. Tnere are imported annually into the United States about 150,000,000 pounds of lemons, mostly from the island of Sicily. If this amount of fruit were expressed in terms of the California method of packing and shipping it would represent more than 1,750,000 boxes, or about 6000 carloads.

In the early days of the industry there were no precedents to follow that were applicable to the handling of the lemon in California. The pioneer growers made many mistakes. Each step forward in the culture of the groves and in the handling and shipment of the fruit was gained by costly experience. Groves were located in unsuitable places, on frosty areas, on uncongenial soils, in localities dependent upon an inadequate supply of irrigation water, or on soil that was overcharged with alkali. The growers had to learn about the handling of the soil, the irrigation and fertilizing of the crop, and the maintenance of soil fertility by cover crops and other sources of humus. The methods of pruning have only recently begun to emerge from a chaotic condition. The losses from decay until recently were so large and so universally expected that the California lemon was generally supposed to have poor keeping qualities, and dealers were cautious about handling the fruit. The industry became so depressed that ten years ago many of the groves were top-worked to oranges.

These conditions, however, are gradually changing. The California lemon growers are men of the highest intelligence and are in close touch with the developments of agricultural science. They are continually learning more about the requirements of the soil and of the trees. They handle the fruit with more care and skill than is bestowed on any other orchard crop of this country, and are developing successful methods of curing and of holding the fruit. The decay in lemons that are handled properly is a less important factor than formerly. The most critical dealer and the consumer both have confidence in the best brands of the fruit. An energetic, organized marketing policy has replaced the former unsatisfactory methods of disposing of the fruit. Special concessions in freight rates have been made by the railroads as a stimulus to the industry, and the most difficult problems of culture, of handling, and of shipment that are not well understood are being studied by State and Federal investigators in co-operation with some of the most progressive growers and shippers.

As a result of the recent progress in the industry, the demand for the best brands of California lemons is greater than the present supply. The area of groves is extending considerably, though more slowly than the growers desire, as the nurserymen have not been able to supply the demand for trees during the last two or three years, their propagation having been almost abandoned when the business was in the most depressed stage. At that time trees were sold at 10 to20 cents apiece, but in the winter and spring of 1907, following three years of unusually high profits, all available trees in the State were sold at prices ranging from 75 cents to $1.50 each. It will be several years before the product of the recent plantings increases the total supply of fruit to any considerable extent.

The Location of the American Lemon Industry.

The American lemon industry is located principally in southern California, which includes the counties south of the Sierra Madre Mountains. The most important region north of these mountains is in Tulare county, where the present annual production reaches about 150 carloads. The lemon groves are scattered along the foothills of these mountains and into the valleys from the coast at Santa Barbara inland to Riverside and Redlands. There are large plantings on the foothills of the Temescal Range at Corona. Along the coast the plantings are scattered here and there from Santa Barbara to the Mexican line, the so-called coast region including an area extending 20 miles or more inland. There are large plantings inland in San Diego county and along San Diego Bay, especially at National City and Chula Vista. The important regions, with their approximate production during the season from November 1, 1906, to October 31, 1907, may be roughly grouped as follows: Tulare county, 150 cars; Santa Barbara and Ventura counties, including Santa Barbara, Fillmore, and Santa Paula, 475 cars; the San Dimas center, including Duarte, Azusa, Covina, Glendora, San Dimas, Pomona, and Claremont, 380 cars; the Upland, Ontarlo, and Cucamonga region, 260 cars; the upper San Bernardino region, including Riverside, Rialto, Colton, Redlands, East Highlands, and near-by places, 470 cars; the Corona region, 570 cars; the Los Angeles region, including Whittier, Lamanda, Fernando, Pasadena, and Hollywood, 440 cars; Orange county, 110 cars; San Diego county, 800 cars; making 3505 carloads from Southern California and 150 carloads from Tulare county.

The lemon-growing sections in Southern California are generally spoken of as the coast and inland regions, though there is no well defined line between them. The altitude of the coast region varies from sea level to 200 or 300 feet. The inland regions range from 750 to 1250 feet in altitude. The climate of the lemon belt, like the climate of the Pacific coast generally, presents the widest variation within a comparatively small area. In general, however, the climate

of the coast is more equable than that of the inland region, the annual mean temperature averaging a little lower and more uniform and the relative humidity higher and also more uniform. The fruit of the coast region is more uniform in texture and in ripening throughout the season; it has a little thinner skin, and the largest part of the crop matures comparatively later in the spring. It has been commonly supposed that the lemons from the coast have poorer keeping quality than the interior-grown lemons, but it is a question whether this difference exists in fruit that is handled with equal care. It has also been supposed that the best coast lemons are produced not in close proximity to the ocean, but from 16 to 20 miles inland; but this, too, is open to question. The scale insects thrive more abundantly in the moister air of the coast, though fumigation or spraying has to be practiced in nearly all sections to hold the insect pests in check.

No Scale in Highland

To the Editor: In your issue of Nov. 19th, under the heading "Agricultural Notes of the Pacific Coast," there appears an item stating that "The Chamber of Commerce of Highland, San Bernardino county, is taking steps to have all of the orange trees of that section thoroughly fumigated and to that end is encouraging the plan proposed recently by Mr. Paine to form an organization to insure freedom from scale in all orchards of members."

Permit me, as an orange grower of the Highland district, to say that this statement is not only untrue in what it alleges, but incorrect in what it implies.

According to the Horticultural Commission of this county there is not now, and never has been, any scale in the Highland district, with the exception of the white scale, which, as everyone knows, is persistently hounded to death by its enemy, the vedalia.

The Facts are as Follows.

The citrus fruit growers of the Highland district—which for the present purpose, is bounded on the north by the San Bernardino mountains, on the east and south by the Santa Ana river and on the west by Lytle creek—have formed a mutual insurance association for the purpose of preventing the introduction of scale into the district, if possible, and for its eradication if it is found, at any time, to have made its entry.

From one view point it is unfortunate that the timely action should have begotten the story, now broadcasted over the land, that the orange groves of Highland are infested with scale. We feel sure, however, that the papers which have innocently spread the report will cheerfully endeavor to correct it, and that the ultimate result of the affair will be the emphasizing of the fact that we are yet free from the pest. Had the incident not occurred the public would doubtless have asssumed that we were equally afflicted with the rest of the citrus regions..

It is an interesting fact that this scale insurance measure is the most attractive co-operative proposition that has ever been made to the citrus growers.

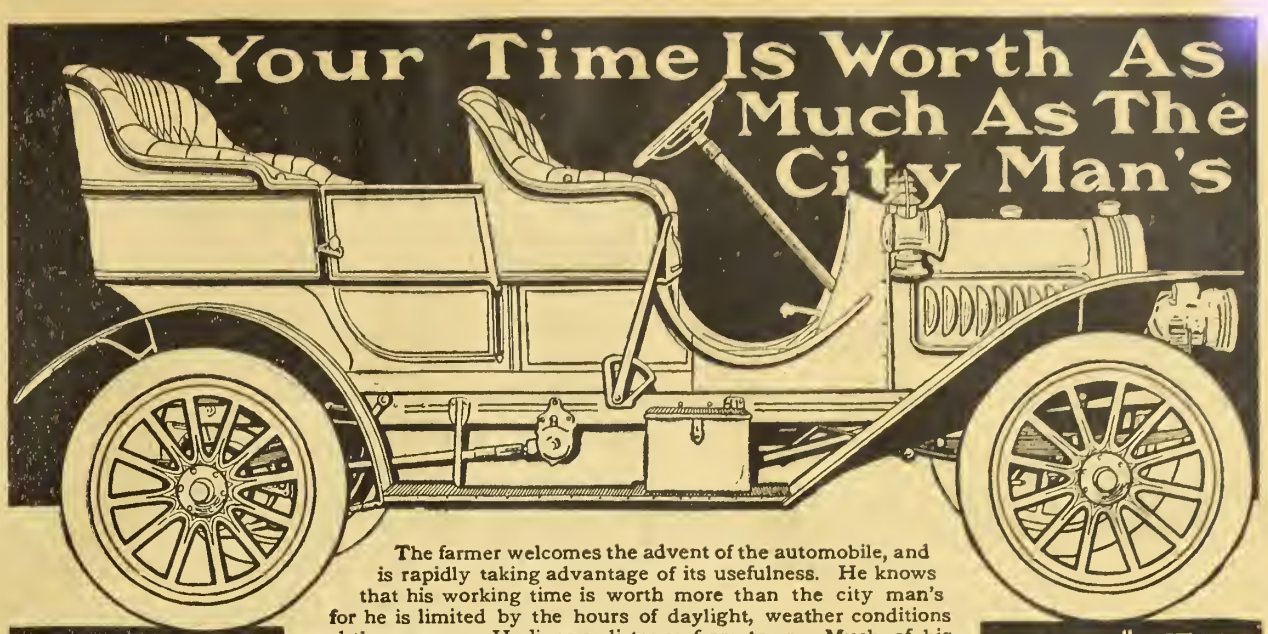
The Agreement.

Briefly stated, the agreement, which has been carefully drawn and passed upon by the best legal talent, provides that if scale be found in the orchard of any member, it shall be eradicated at the expense of the association. To provide an immediately available fund an assessment of twenty-five cents per acre is collected as an entrance fee. As there are about 4000 acres of orchard in the district, and as every grower, apparently, is preparing to join, the association will have a sufficient sum in hand for initial work, if the need arises, and the agreement provides for further levies if they shall become necessary.

We are persuaded that the time-worn maxim concerning the ounce of prevention is nowhere more apt than here.—W. M. Bristol, Way-up Ranch, East Highlands, Nov. 24, 1908.

We regret the Cultivator's mistake and thank Mr. Bristol for coming squarely back at us with his clean-cut statement.

We are glad to know the truth and also glad to have the particulars of this Highland's co-operative effort which is well worth imitation in every fruit growing section.



The farmer welcomes the advent of the automobile, and is rapidly taking advantage of its usefulness. He knows that his working time is worth more than the city man's for he is limited by the hours of daylight, weather conditions and the seasons. He lives a distance from town. Much of his time is taken up traveling back and forth. The school house and church are far away. His horses are needed in the fields. He has greater and more legitimate use for an automobile than his city brother, and the car best fitted to his many needs is the

Rambler

THE CAR OF STEADY SERVICE

With it he can make the trip to town and back in less than half the time it takes a team and at the same time leave the horses to more profitable work on the farm. He can take the children to school, the family to church, or visiting in all kinds of weather over all kinds of roads. He not only gets more time for his necessary work, but he gets more time for pleasure, something the American farmer does not get enough of. Farmers in practically every state are using RAMBLERS, and many of them claim that the up-keep is no more than the keep of a horse. They use their cars to carry produce to market, haul milk to the creamery and for many utility purposes. The RAMBLER always gives a good account of itself, and transports the farmer and his family with speed and safety. It is not expensive or hard to operate—anyone can run a RAMBLER. Its large wheels give ample clearance for ordinary obstructions. Its big tires travel all kinds of rutty, sandy or muddy roads easily, with little tire expense; the double opposed engine gives great power on the road—wonderful hill climbing power; the Rambler method of transmitting power to the driving wheels reduces friction. The unit power plant and all other parts are protected against injurious road materials; 400 inches of braking surface insures perfect control; the tilting body allows you to reach every part easily and quickly; the long wheel base gives ease and comfort.

Farmers with keen judgment of comparative values are buying Ramblers. We want you to know all about this automobile—why it is the best car for you to buy—why it is the right car at the right price. Let us send you our Farm Folder No. 156; it tells you how much pleasure and profit there is in a RAMBLER for YOU. Write for it today. It's FREE.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths, Fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials

Deciduous Fruit Culture

By J. W. Mills

FOOD VALUE OF DRIED FRUITS.

THE value of dried fruit as a food product is very little understood by the one who should be most interested, the housewife; if it were, the consumption would increase so fast that the producing sections of the country would be severely taxed to supply the demand. It is equally as valuable to the rich as to those who are obliged to count the cost of living closely. High grade dried fruit properly prepared will furnish as appetizing a dainty as ever appears on the table. The early education of most housewives leads them to believe that dried fruit is only the commonest of food and is only to be used as a makeshift. If they would take the trouble to inform themselves as to the great improvement that has been made in curing and preparing this article for the market, and the experiments that have been made to prepare from it a dish to tempt the palate, they would be more than surprised at the important and beneficial place dried fruit would assume in their daily menu.

The average wholesale and retail buyer is equally in the dark as to the methods of preparing dried fruit for the market, and of the difference in value of dried fruit from the various sections where it is produced, and, above all, the difference in value of properly and improperly prepared fruit. If he would so inform himself and govern himself by that information, insist upon having such dried fruit as is properly handled, delivered to him on his purchases, he would make new friends and customers, both for himself and for that too often despised article—dried fruit.

Prunes for Example.

Take the one item of prunes to show how small comparatively the consumption of dried fruit is in the country. An average crop of prunes in California, Oregon, Washington and Idaho, the prune producing States, is for the present acreage from 150 to 180 million pounds, or about 2¼ to 2½ pounds per year to each inhabitant. What is true of prunes is true of other dried fruits, and yet there is not one of the many items that go to furnish the table that will show better results from its free use in nutriment, pleasure of eating and economy.

As to Sulphur.

The practical dried fruit men of the country are unanimous in their opinion that it is necessary to use sulphur to prepare a sightly and good keeping article of food, insofar as peaches, apricots, pears and aples are concerned, and their opinion is based on years of actual experience and experiment. They deplore and discourage the excessive use of sulphur as they would the excessive use of anything that might in excess produce bad results, and they are as honest and much more vitally interested in their position than the theoretical expert who, as is usual with the reformer, is in a measure trying to pass laws and bring about rules and regulations that will destroy a valuable industry. by criticising its methods without offering better ones as a substitute. I am sure that I am safe in saying that not one case of injury to health has ever been found from the use of properly cured sulphured fruit, and I am sure that the general health of the dried fruit consumers of the country will at least compare favorably with that of the non-consumers.

No one would welcome improved methods of curing dried fruits more than the grower and packer—I mean practical, economical methods—but up to the present time no such substitute for the present methods has been found. It is said to be true that the kinds of fruit above mentioned have been successfully cured without the use of sulphur; but while the methods, so far as I can learn, might do for laboratory experiment, and in that be successful, they are absolutely impracticable for handling the enormous dried fruit output of this country.

Dried fruit has come to stay, and is gaining firmer footing in the family every day. If the producers and merchants will see that only good, wholesome, well cured, well prepared fruit is sold, in a very short time the demand will exceed the supply.

Higher Standards.

The dried fruit business is getting on a firmer basis every year. We are coming to recognize standard qualities and gradings more and more. The business of packing and shipping is slowly working into the hands of comparatively few reliable houses, and they are doing much to establish uniform standards of quality and to eliminate that element whose methods are dishonest and unfair. Much ground for good has been gained in the last few years and the business is now on a firm, well-established footing. The only thing necessary now is to bring the packers and natural distributors together on a uniform, equitable basis. —Walter A. Frost in the Retailers' Journal.

A CIDER VINEGAR.

According to the Carolina Experiment Station the following is the way for making cider vinegar:

Take sound barrels, or any suitable sized vessels of wood, earthenware or glass— never iron, copper, or tin. Clean thoroughly and scald. Fill, not more than half full, with the cider stock, which should be fermented at least one month. To this add one-fourth its volume of old vinegar. This is a very necessary part of the process, since the vinegar restrains the growth of the chance ferments which abound in the air, and at the same time it favors the true acetic acid ferment. Next add to the liquids a little "mother vinegar." If the latter is not at hand, a fairly pure culture may be made by exposing in a shallow, uncovered cork or wooden pail a mixture of one-half old vinegar and one-half hard cider. The room where this is exposed should have a temperature of about 80 degrees F. In three or four days the surface should become covered with a gelatinous pellicle, or cap. This is the "mother vinegar." A little of this carefully removed with a wooden spoon or stick should be laid gently upon the surface of the cider prepared as above described. Do not stir it in. The vinegar ferment grows only at the surace. In three days the cap should have spread entirely over the fermenting cider. Do not break this cap thereafter so long as the fermentation continues If the temperature is right the fermentation should be complete in from

S. H. Taft

Sawtelle, Cal., Nov. 27, 1908.

The repair of the levee on the Feather River at Marysville is nearly completed.

four to six weeks. The vinegar should then be drawn off, strained through thick white flannel, and corked or bunged tightly, and kept in a cool place until wanted for consumption.

If the vinegar remains turbid after 10 days, stir into a barrel one pint of a solution of one-half pound of isinglass in one quart of water. As soon as settled, rake off, and store in tight vessels. Usually, no fining of vinegar is needed. No pure cider vinegar will keep long in vessels exposed to the air at a temperature above 60 degrees F. "Vinegar eels" are sometimes troublesome in vinegar barrels. To remove these heat the vinegar scalding hot, but do not boil. When cool, strain through clean flannel, and the "eels" will be removed.

DATE GROWING IN CALIFORNIA.

Continued on Page 531.

small percentage of the poisonous salts. This is very noticable in the Tempe garden at the present time. The plantation was made in 1900 on land where alfalfa had been killed out, and similar to lands which Thos. H. Means, of the Bureau of Soils, had found to contain about 2½ percent by weight of harmful soluble salts on the upper 12 inches. At the present time there is a marked alkali crust over the whole area, and the problem of keeping down weeds is practically eliminated, for few attempt to grow. Young plants from seed sprouting under the trees turn brown at the surface of the soil and die before the end of their first summer. The caretaker has been unable to surround his house with any shade trees, a single pomegranate bush being the only woody plant besides the dates able to survive in the enclosure. The fact that the ground water rises very quickly when the surrounding alfalfa fields are irrigated shows that there is a free movement of water in the substrata, probably a part of the great Salt River sub-flow, and the date roots are doubtless growing in a soil with a low percent of alkali and not liable to stagnation. In this discussion it should be remarked that only the so-called white alkalies, the chlorides and sulphates are referred to. While the date is in a degree resistant to the black alkali, sodium carbonate, but a very small percent of it could be tolerated.

These facts regarding the date palm are of the utmost economic importance in relation to the development of Southern California. In both the Coachella and Imperial valleys, with climatic conditions equal to any in the world for the production of dates, there are hundreds of acres of land backed by an adequate supply of water either from artesian wells or from the Colorado River, where the surface soil is somewhat too strong in alkali for the growth of any known field crop, yet where the date would thrive most admirably.

More About California Prosperity

Replying to recent criticism of a statement written by Mr. Isaac which the Cultivator responded to, Mr. Isaac now writes:

"I note that one of your correspondents takes you to task for a short item written by me which appeared in your columns. It is too often the case that a person sees nothing outside of his individual case. If he is prosperous, then all are prosperous, but if he is in adversity, then all are. I think that this is the case with your correspondent. He sees only his own case. Now, there are very many individual cases of adversity, there are sections in the state in which the past season cannot be accounted a good one, but I contend, and the facts will bear me out, that as a whole, the past season has been a prosperous one to the tillers of the soil in our state. Citrus fruit shipments were heavy, and while there were some losses, as a rule, they were remunerative. Of fresh fruits we have shipped in round figures 12,000 carloads, the heaviest in our history, and as with our citrus fruits, as a whole, prices have been fair to good. Growers of table grapes are prosperous. Orchardists who have sold their fruit to the canneries have generally got good prices. The threat of a dry season last year was thwarted by late seasonal showers, and while hay and grain were both short, they were better than we had for a while expected. So it is with other lines of agriculture and horticulture. Being in touch with the whole state and knowing conditions as I do, I do not hesitate to reassert my statement and say that, taking the state as a whole and in its various branches of agriculture, the past has been a prosperous season."—John Isaac.

* * *

On the same point Mr. Y. J. Henninger of Auburn, Placer county, writes:

"Will you kindly publish this or send it to Mr. Isaac's critic as an encouragement for him to look ahead a little and raise something that will sell and give him a fair profit? In particular I want to give him my experience.

"I came here two years ago from the East and bought 20 acres of improved land. The land has a gentle slope to the southwest. Ten acres are in orchard, principally plums, on which my income was $400 net this year. Of the other ten acres I have six fenced off for raising natural hay, (about 5 tons). This I keep enclosed four months in the spring until I get the hay off in the barn; then I have the whole ten acres for pasture.

"I have five head of stock to feed and I do it on those ten acres. I started in with a mare, who does all the work on the place, and her colt. I will sell the colt later on and get a cow in its place. I also started in with one pure blooded Jersey cow and her calf. I have now one two, and one one-year old heifer, each cow giving milk I consider worth $12 per month to me. I get 10 cents per quart for pure milk and 35 cents per pound for butter but I don't make any butter in the summer time.

"I have a piece of ground 150 feet square on which I raised 35 bushels of corn on the cob, which came in handy for fodder and chicken feed. I raised fodder only on this piece of ground this year. It doesn't pay to raise corn for chicken feed. In fact I am going to cut the chicken business out. Tney got all the corn and all my grapes, too.

"I am improving my orchard right along by grafting to better plums. I want to advise Mr. Isaac's critic to turn his five acres into red top clover and water it well and get himself a bunch of Jersey calves, if he is living near a city, and sell nothing but pure milk. I have no doubt I paid no more for my 20 acres than he did for his 5. There are three of us and we do all our work ourselves. We are in the best of health. In these foothills here is the best of water and a glorious climate to live in."

California Horticulturally

By John Isaac

POPULARITY OF THE FIG.

THE fig crop of the San Joaquin and Sacramento valleys has not turned out so well as usual and the pack will fall much below normal. But, then, this has been an off season for many kinds of fruits, so that growers and planters are not discouraged. Since the introduction of the fig insect and the possibility of producing first-class commercial figs, a great impetus has been given to the planting of this fruit which has increased each season and the present season will see no diminution in it. Several projects are now on foot to plant large areas in figs in both the San Joaquin and the Sacramento valleys. Two of the most extensive of these are in Glenn and Merced counties. In the former an eastern company is arranging to put out six hundred acres of Smyrna figs in one tract, while in Merced county a company has purchased a large portion of the old Holland colony tract, and is now preparing to put out five hundred acres in figs and peaches, principally figs. There is no question but that with suitable soil figs will do well in both the great valleys. The fig requires a warm climate to do its best and that there shall not be too great an extreme in the temperature between night and day. Sudden changes chill the stems of the young fig and cause the fruit to drop. While some of the more hardy varieties will do well on the coast the best results in fig growing for profit are to be had in the interior valleys.

WINE GROWERS NERVOUS.

The wave of temperance or prohibition now sweeping over the United States is having its effect even in California, which is so far outside of its present activity. The owners of the large wine grape vineyards and wineries, are looking at the coming cloud with much apprehension, and are already wondering where the tidal wave will leave them when it has passed. The wine industry is one of the largest fruit industries in the state and in it are invested millions of dollars, represented by vineyards, wineries, cooperage cellars and other

Continued on Page 551.

Small Fruits and Vegetables

CO-OPERATION IN MARKETING FRUIT AND TRUCK CROPS.

THE Department recently issued a bulletin in which the subject of co-operative marketing on the part of the gardeners and small fruit growers was discussed, from which the following is taken. It in turn was made up of extracts from various state bulletins:

Some Advantages.

The co-operative idea among fruit and truck growers, having passed the experimental stage, has become an important factor in present day marketing. Scarcely any well-developed horticultural sections are without their associations in one form or other. New fruit and truck regions are being constantly developed, however, and a brief study of co-operative methods may be of value. The benefits to be derived from such organizations are many. Small producers can make combined shipments in car lots, which is now considered the economic unit of shipment. Organizations, through the volume of their business, can secure minimum transportation rates. They can afford to maintain daily telegraphic communications with all of the important markets and are thereby enabled to divert cars already en route to places where the demand is greatest. Growers are advised when to hold and when to ship. Uniform grades and packs are secured. Organizations are in a position to know the actual supply of their respective communities; hence managers, working in harmony, can regulate prices to a considerable extent. Through the association the members can procure packing material, frult-picking baskets, spraying materials, and pumps, potato bags, etc., at a greatly reduced cost. Successful associations require choice products. By an interchange of ideas and experience members are in a position to eliminate unprofitable varieties of fruits or vegetables from the community and to develop thorough and economic systems of cultivation. These and many other advantages might be noted.

Co-operative associations have developed rapidly in the West. Over thirty fruit and produce organizations of various kinds are now doing business in Colorado. In a recent publication of the Colorado Station, W. Paddock describes the workings of these associations, which in a general way are similar to those of other sections.

There are two methods of packing and grading fruit; in one instance the association does all the packing, the growers delivering the fruit to the packing house just as it is taken from the trees. Here the packers, under the direction of a superintendent, sort the fruit into the various grades, and at the same time pack it into boxes or crates. Should there be any culls they are returned to the grower and are at his disposal.

Each grower is given a number, which is used to designate his fruit throughout the season. As each box is packed it is marked with his number and the grade. When the boxes are loaded into the cars the number of boxes, the varieties and the various grades which belong to any grower are kept account of and duly recorded. In this way the price for each box of fruit in any car is easily determined.

But where there is a very large amount of fruit to be handled it is impossible for the association to do the packing, consequently the growers assume this work. With this arrangement the association employs an inspector, whose duty it is to inspect each load as it is delivered. This he does by opening the boxes on the side in the case of apples, when a good estimate of the contents may be made. If the pack is satisfactory not more than two boxes may be opened. If unsatisfactory, several may be examined, and if all run under the inspector's standard, the entire load must either be placed in a lower grade or else be repacked.

It will be seen that a great deal depends on the inspector, and that it is a dfficult position to fill. Upon him depends the reputation of the association, so he must be entirely free to do the work as he sees fit.

Each man's fruit is kept track of by numbers, as in the former case.

The association charges a commission on all sales, usually 5 per cent, to defray expenses. Then, in case the packing is done by the association, an additional charge is made to cover the cost of the box and packing. Any surplus is, of course, distributed as premiums. Any fruit grower may become a member of the association so long as there is stock for sale, and the owner of one share is entitled to all of its privileges. The number of shares one individual may own is limited.

The growers are generally asked and, in many instances, required to furnish an estimate of their crop. In the smaller associations the manager sometimes secures this information by visiting the orchards in person. This estimate is made early in the fall, or not until damage by worms and other causes is practically over and the crop is secure. With this knowledge in hand, the manager can enter into contracts for delivering certain amounts of various varieties or grades.

Not to Commission Men.

The system of selling has been radically changed within the past few years. Formerly practically all of the fruit was consigned to commission men, who, as a class, it may be truthfully said, are inclined to do the best they can by their constituents. But too often the experience has been otherwise. Not infrequently has it happened that shipments consigned to a distant city have been reported as not being up to grade, or not in good condition, so the market price could not be realized. In such cases, though the manager may be certain that his fruit is as represented, he is often unable to help himself, so must take what he can get. But of late years the plan of selling f. o. b. is being practiced more and more, and this is largely due to the organized efforts of the associations. Consignments are only made to well-known firms, and much of this fruit is sold at auction.

But even with this arrangement difficulties arise, so in order to protect themselves the larger associations have an agent at the more important distributing points. It is the duty of the agent, or broker, to inspect all cars which come into his territory, as near the destination as possible, and thus protect the association from dishonest buyers. He also is on hand to adjust the differences which arise when the fruit actually reaches the buyer in poor condition.

Live Stock and Dairy

By Mrs. Minna E. Sherman

THE COW.

THE price of butter fat soars high these days, over thirty cents; 32 to 35 was paid last month by many of the creameries. Grass is short and the high prices received make one think the cows might be pushed into giving more butter fat. Those that have come in fresh surely could be helped along with a little grain. The dealers are called up and prices asked—$34.00 for bran, 3.31 for rolled barley, 3½cents a pound for oil meal. One ton of rolled barley, one ton of bran and five hundred pounds of oil meal give us 4500 pounds of feed costing $81.50, about a cent and seven-eighths a pound. Four pounds a day to a cow would cost seven cents a day or about $2.10 a month. The amount of one quart twice a day would be close to four pounds daily. It is a small amount of feed at one time but when added to the ration of alfalfa and hay that is already producing some profit it will count. Regularity is, after all, more to a cow than the large quantity she receives. When silage is fed with plenty of good alfalfa hay the grain does not bring in enough extra profit to pay for itself. Where there is no silage, while the amount of grain seems very small, if it is added to chopped up pumpkins enough to make a couple of quarts or more, or say a feed of three quarts all told, it will pay if the cows are not in the down drop of their milk flow. It is always useless to think of increasing cows' milk after they have been let shrink down below one-half the regular amount. So many people never think of feeding the cow until they find the milk for the family short. it is then too late to do very much; the first shrinkage must be caught and stopped.

Quantity.

It is said that a cow should have at least seven pounds of grain for eacn pound of butter fat she produces. Tneoretically it should pay, as the prices of butter fat by the pound are twenty times as much as the price of grain. Yet, we are dealing with life, not with figures, and cows will not always be good enough producers to make the books balance. The high price of skilled labor, also, has much to do with losses of the dairyman. Labor we must have and it comes high. If the milking machine is ever going to help us out it will find every one ready for it. At present the dairyman should have a good big family. The men were saying the other day that a man arrested for not supporting his children ought not to have to work. He claimed to have fifty. What could not a man with this working force do in the dairy business?

Concentrating Rations.

At the Ohio Experiment Station an interesting test of the values of different rations was made that seems to be in line with this paper. A number of cows were fed as follows, counting the two rations on the basis of the amount of dry matter per hundred pounds of feed: When nearly 58 per cent of the dry matter came from grain, the cows gave a fraction over 81 pounds of milk containing 3.9 per cent of butter fat for each 100 pounds of dry matter. The grain cost $1.05 for each 100 pounds of milk, making the butter cost 22 cents a pound. The monthly profit for each cow was two dollars and forty-six cents. Now for the silage fed cows. From fifty per cent dry matter from silage the cows produced ninty-six and a half pounds of milk with over 5 per cent butter fat for each 100 pounds of dry matter. The silage cost 69 cents, making the butter fat cost 13 cents a pound and the net return was $5.85 cents a month per cow.

Shrinking

This year has seen the mistake repeated of letting the cows drop down in their milk during the fall months—butter fat goes up every fall, yet the average producer of milk tries to skin along without buying feed, in hope the grass will start early enough to keep the cows milking. I have had cows for twenty years and only one year did the grass come early enough. As far as the rest of the crops on the ranch were concerned, it was the most disastrous year we have ever had. The cows should be encouraged to come in fresh each fall, anywhere from September to Christmas time. Then make provision for feed early in the year for them and they will prove profitable. On the other hand, to simply let them drift along in any old way will not in ordinary years make the cows more than pay their way. If no thought is put into the work we do, then the profit may be considered as a happy accident, not as a result of forethought. Fortunately in California many happy accidents occur to the dairymen and fruit growers.

Short Milkers.

A common fault with our cows is the short milking season; some milk seven months, some eight, and some nine. That is about the average of the cows offered for sale. Now, if ten cows lose each three months a year it makes thirty months each year, or the milk of two and a half cows out of every ten. The cows need to go to school as well as the dairyman to be properly trained to their work. In ten years the loss of ten common cows would build a good silo. A further reason for fall freshening is, the calves do better in the winter months and are ready to eat the first good grass. On the ranch the fall calves outgrow the summer calves; this fall's calves will be as large next winter as the last summer calves that are several months older.

Feeding the Calves.

The fault that costs the lives of many calves is too cold and too much skim milk. The milk should be warmed and the calves fed only until their sides are level full and not until they look like little beer barrels on four legs. When any trouble rises among the calves it is usually with the bowels. Back of it all is indigestion. Now for this the simple remedy of rennet will be found better than those containing morphine. The common junket tablet at ten cents a package will answer. The skim milk is made hot and given to the calf blood warm. Have the rennet tablets dissolved in a bottle, as many as are needed to make junket of the amount of milk the calf is being fed. Just as the calf's head goes into the bucket the junket tablet water is poured in. Then always remove the well calves, leaving the sick ones behind. The floors should be sprayed well with some of the coal tar preparations and all soiled bedding burned.—M. E. S.

SHEEP BREEDING.

From the station records, which have been kept for 240 ewes and which cover a period of 5 years in continuation of previous work, the following conclusions were drawn by the Wisconsin Experiment Station observers:

"The normal period of gestation, or the time from which a normal ewe is bred to the time of lambing, ranges from 145 to 151 days and the greatest percentage of ewes will lamb 147 days after service.

"The gestation period appears to be somewhat longer for the male than for the female.

"The percentage of males born is practically the same as that of females.

'The larger percentage of lambs born on or before the 147th day of pregnancy is strong, and after this time the number of weak and dead lambs is greatly increased.

"The number of days a lamb is carried in utero does not seem to have any effect on its size.

"The largest percentage of increase is due to twin lambs, and there is no appreciable difference in the percentage of twins of the different breeds.

"The production of twin and triplet lambs is detrimental to the strength and vitality of lambs at birth.

"Shropshire ewes appear to be more prolific than any other breed.

"Ewes 6 years old produce the largest percentage of increase, while young ewes have the greater percentage of single lambs. The percentage of ram lambs increases and the percentage of ewe lambs decreases as the age of the ewe advances.

"A ram is at his best at 2 and 3 years of age.

"The age of the ram does not have any effect on the sex of the offspring.

"Ram lambs average about one-half pound heavier at birth than ewe lambs.

"The larger the ewe the greater the percentage of increase, while the ram has no effect on the lambs in this respect.

"The size of the ewe and not the size of the ram determines the size of the lamb."

THE BEST TIME TO WATER HORSES.

A horse should be watered before feeding, and never given a large quantity of water after a meal, for the simple reason that the water will wash the food out of the stomach before stomach digestion has taken place, and the food will not be well prepared for absorption; and besides it is sometimes the cause of colic.

There is a popular idea that a warm horse should not be allowed to drink and, unlike a great many other popular ideas, there is a little truth in it. If you water a warm horse in the ordinary way, letting him drink all that he will, you are likely to have a foundered horse on your hands. This is especially so if, at the time, the horse is fatigued. Nevertheless, it is always safe to allow him from six to ten swallows, no matter how warm he is. If this be given on going into the stable and he be allowed to stand and eat hay for an hour and is then offered water, he will not drink nearly so much as he would had none been given before.

The danger is not in the first swallow, as we often hear it asserted, but in the excessive quantities he will drink if not restrained. The most dangerous time to give a horse a full draft is when he has cooled down from fatiguing work and has partaken of a meal.

John Splan, the great trainer, writes: "As to water, I think that a horse should have all that he wants at all times. A man says: 'Why; will you give your horse water before a race?' Yes; before the race, in the race, and after the race, and any other time that he wants to drink. When I say give your horse all the water he wants before the race, I do not mean that you shall tie him in a warm stall where he cannot get a drink for five or six hours on a hot day, and then take him to the pump and give him all that he wants. What I mean is to give him water often and, in that way, he will take only a small quantity at a time."

After long, continuous exertion the system is greatly depleted of fluid. Nature calls for its replacement, and this is the cause of a thirst which is so intense that, if the animal is not restrained at this time, he may drink much more than he needs.

The custom, almost universally followed, of giving the morning meal before water, is not very objectionable, either theoretically or practically. At this time there is no depletion of fluid, consequently the horse is not very thirsty and does not drink rapidly or excessively, and apparently very little evil results from this method. However, the writer much prefers that the horse should have an opportunity to drink before the morning meal.

Personally, I much prefer keeping horses, both summer and winter, in an open shed, with a large water tank in the yard, to tying them by the head in a barn.—F. W. Culver, M. D. C., Colorado Agricultural College.

WAYS TO HANDLE A HOG.

The handiest little contraption we have is for moving a hog or pig from one place to another, says A. Homan, in Field and Farm. It is a common shipping crate mounted on an old walking cultivator arch to which the wheels are fastened the same as on a cultivator. The arch has to be raised near the opposite end from the open one so that when that end is resting on the ground the slant is not too steep for the hog to walk onto. It is easy to get a hog into a contraption of this sort as it thinks it is going to walk right through and out, and with two handles on the exit end it is easy to wheel the hog where wanted.

WHITE SPOTS ON HORSES.

A white spot on the forehead of a horse is called a "star." A white face from eye to eye is a "bald face." A strip between the nostrils is a "snipe." A white eye is a "glass eye." A horse has pasterns, not ankles. White around the top of the hoof is a "white coronet." White above the pasterns is a "white leg."

Great care should be taken not to over-feed the sow for the first few days. The skillful feeder will regulate her feed so that her milk supply will increase about as fast as the demands of her litter for it increase until at about two weeks of age they are taking about all their dam is capable of giving when on full feed.

When pigs are kept eight months, when fully as good weights could have been obtained at six months, the profit is anything but what it should have been.

COUNTRY LIFE COMMISSION.

President Roosevelt is nothing if not original and the best of it is his originality works itself out along lines which lead to the uplifting and betterment of conditions of this country. This was eminently true of his gathering of Governors to consider questions of conservation of our national resources which mean so much to our future welfare.

Equally as practical, though not looking toward such immediate financial returns to the nation at large, is the commission recently appointed to investigate as to conditions now prevailing in the home life of rural districts. To gather this information this commission has taken several methods. First, the farmers of the country at large have been asked to write their opinions as to steps that might be taken to better their own social, intellectual and financial conditions.

In addition over half a million of blanks with a series of questions have been sent to all parts of the United States to draw out opinions of the needs of the farmer. In addition, the commission of seven members plans to visit, so far as possible, all sections of the country and personally observe conditions as they prevail.

The commission consists of Prof. L. H. Bailey of Cornell University, Chairman; Henry Wallace, Editor of Wallace's Farmer, Des Moines, Iowa; Dr. K. L. Butterfield, President Massachusetts Agricultural College; Gifford Pinchot, Chief Forester, Washington; John Barnett, W. A. Beard of Sacramento, and Walter Page, Editor of World's Work. Messrs. Page, Pinchot, and Barnett are the part of the Commission which is visiting the Southern states. Messrs. Bailey, Wallace, Butterfield, and Beard are the Commissioners visiting the West. Accompanying them from other departments of Governmental service are C. J. Blanchard of the Reclamation Service, Dr. C. W. Stiles of the Marine Hospital Corps, J. A. Rice, official stenographer.

THE COMMISSION IN CALIFORNIA.

The first hearing of the Commission in California was in Los Angeles on Wednesday night of last week. Later a meeting was held in Fresno, then in Sacramento and San Francisco, making only four sessions given to this state. Doubtless every other community in the state will feel itself slighted in a measure because no sessions were held in its immediate vicinity. But it must be borne in mind that while the entire commission was split in two parts, one part visiting the South and the other the West, that the extremely short time given to accomplish the work permits the Commission to visit only forty states of the Union. Therefore while California receives but four calls from the Commission there are other states which it has not been able to visit at all. As it is, Southern California has one visit, Central California one, and Northern California two.

CALIFORNIA CONDITIONS IDEAL.

Some of the daily press in referring to the session held raised the point that the general trend of the hearings went to show that California conditions are such that the Commission has little to suggest for their betterment. As true as this may be from newspaper or from a promotion standpoint the sessions drew out in a way, which the shrew men composing the commission will be able to read between the lines, that with all her perfections California still has some need for changes which will make our rural life more attractive than it now is.

ITS MISSION.

Chairman Bailey, in his statement as to the work of the Commission and its scope, in so far as it was concerned, said absolutely nothing would ever be given to the public, in printed form, or otherwise. The only report which would be made would be direct to President Roosevelt and the facts were to be used only as he might direct. This report must be in the hands of the President before the last day of December.

EDUCATIONAL.

Amongst the main points which have been brought out before the Commission is the one of education as affecting country life conditions. Is it offering today all that the rural districts demand? On this point Prof. E. J. Wickson who met the Commission in Los Angeles and accompanied it through the state made the point that in this particular, California was well in the lead amongst the states of the Union. He pointed out the work of the Agricultural College of the State University, the State Farm High School at Davis, the Polytechnic High School at San Luis Obispo, and plans for another agricultural high school on the Kearney estate at Fresno, and also supported by private funds, an Agricultural High School in Imperial valley.

These schools have an average distance apart of 250 miles and are but a mere touching of the great field of agricultural education in this state. He maintained it showed the willingness of the state to make a start along this new educational road.

County Superintendent Keppel of Los Angeles made an appeal for national aid for education in rural districts. Prof. Bailey asked him if he would consent to control of these schools by government supervision and Mr. Keppel felt that the supervision should be only general and should so far as the government is concerned be largely local in detail, conditional upon certain general regulations being met.

"Less money for battle ships and more for educating the youth of rural districts in the things that are rural and that surround them every day would add more to the strength of the nation than preparations for war."

Larger school grounds, in no case less than 4 to 6 acres, and these to be used in the interests of education along agricultural lines. The greatest lack in giving the kind of teaching needed in country schools is the lack of teachers qualified to give such instruction. The point was made that as a rule the profession of teaching is made the stepping stone into the matrimonial market rather than being taken up as a life work to be persisted in to the end. The professional teacher is more common than formerly, however.

It is harder to secure teachers for rural schools than for city schools, for the reason that better salaries are paid, can be paid, and besides advantages can be offered in the city which the country does not afford. Government aid may increase the pay and communities should be encouraged to increase the farm libraries, social life and other features.

As a rule so far as any reference was made in regard to the Davis Bill which was defeated in the last session of Congress it was supported and its ultimate passage urged as an aid to agricultural education.

The point of the government establishing a correspondence school along agricultural lines was urged by Mr. Fell of El Centro.

PARCELS POST.

It goes without saying that the Parcels Post was brought to the attention of the Commission in a very forceful way. What report along this line the Board will make to the President is unknown, but sure it is that greater pressure will be brought upon Congress this year than ever before to give the country that which will be such a material factor in advancing the welfare of the remote districts.

CO-OPERATION.

One feature only slightly touched upon before the Commission which has a vast influence for the betterment of country life conditions is that of co-operation. Mr. P. J. Dreher brought this out very forcefully in a moment's talk. "Aggregations of capital in larger or smaller volume, as well as combined effort of a number (greater or smaller) of brainy men are required to conduct and make success out of present great business enterprises, which success cannot be attained by individual effort and limited means. Should not the rural resident, be he fruit-grower or farmer, pattern after these successful manipulators, or co-operators, for they are such, excepting that in their case a few co-operate with large means.

"Co-operation and united effort can do what is impossible with the individual. This is an age of specialties, so that each separate branch of the successful business has a specialist at the head of it. As an illustration, the co-operation of growers in the California Fruit Growers' Exchange has by united effort doubled the value of properties as well as earnings. The industry was on the wane and going to decay when necessity forced the growers to co-operate. It is now on a higher plane than ever before."

Shop Talk

OUR CHRISTMAS OFFER—So many of our readers appreciated this offer a year ago that we will repeat it this season. There is no more appropriate Christmas gift than a subscription to the **Cultivator**, for your relatives and friends, either here or "back East." We make the suggestion attractive, also, by crediting your own account three months. Neither is there any inconvenience to you except to fill out the blank found on another page and enclose it with a dollar to us. We will then advance your date of expiration three months, and enter the new subscription, to continue to January 1, 1910. Also, to save you any bother in the matter, we will mail to each person to whom you desire the paper sent, so as to reach them at Christmas, a letter giving your name as donor, and the length of the subscription. Remember that in order to get the credit these must be new subscriptions and not renewals. It is also understood that they are to be discontinued at expiration unless otherwise ordered.

CLUBBING ORDERS. Don't neglect those clubbing combinations we offered in our issue of November 19th. It is an opportunity not to be overlooked, and orders should be sent at once to receive the January issues. Subscription can start with any month, but most people like their subscriptions to begin and end at this time of year. Better attend to it while it is fresh in mind.

Agricultural Notes of the Pacific Coast

Northern California

Petaluma ships four and one-half million dozen eggs every year.

The California Pigeon Club holds its third annual next week at Oakland.

A carload of prunes was shipped direct from Winters to Germany last week.

A warehouse containing 150,000 bags of grain was recently consumed at Woodland.

The rate charged by the Butte County Canal Company has been raised to nearly double its former price.

Oroville, Thermalito and Palermo sections in Butte county have shipped more extensively of oranges than formerly up to this date.

Up to November 20 Yolo county had had no rain since February which is the longest dry spell known in that country.

Fruit growers of Humboldt county are taking the first steps toward having a big cannery constructed on the water front at Eureka.

Glenn county claims the unique distinction of having the only exhibit of rice made by this state in the Ferry Building, San Francisco.

Prof. Leroy Anderson of the State Farm at Davis recently gave the initial reception and entertainment to students attending the short courses.

The stockmen of the Tahoe National Forest held a meeting at Nevada City recently to discuss matters of interest. There were 250 stock owners present.

The high prices which have prevailed for grain during the last few months have been very satisfactory to the large number of grain growers of the Sacramento valley.

It is reported that the Department experts looking after some method of controlling the thrips are meeting with a measure of success which gives hope of ultimate control.

C. H. Taft, sales manager of the Petaluma Incubator Company and known to poultrymen all over the coast from his extensive travels among the poultry people, died at Petaluma last week.

The Farmers' Demonstration Train which visited many sections of the Sacramento valley was well received by the farmers and it is believed has been the means of giving great good to all who attended.

A State Horticultural Fruit Growers' Convention is being held at Sacramento this week. In connection with it is an exhibit made up from the special exhibition cars which accompanied the Institute Train through the Sacramento valley.

The organization of a state poultry association which will concern itself more with marketing and co-operative purchasing of supplies than with exhibition of fancy poultry is coming closer to perfection than ever before. The secretary of the Petaluma Association is pushing the matter.

The Experiment Station Train which took a trip through the Sacramento valley was such a complete success that it has been laid off for making more extensive arrangements for other trips in Central and Southern California. The cars were found to be arranged poorly for handling the large crowds that visited them, making necessary more room for people.

Central California

Turlock ranchers held a rabbit drive last Saturday.

Two thousand acres of land near Merced are to be brought under water.

Tulare county citrus district has shipped out about eighty cars of fruit per day.

The Union packing house at Porterville is forwarding about eight cars of oranges per day.

Orange shippers in Tulare county were somewhat embarrassed by shortage of refrigerator cars.

One of the more recent additions to the raisin pool is the Kearney estate which signed up 700 tons.

Packing houses in Sanger are recently shipping out fresh grapes and the new crop of oranges at the same time.

The principal place of business of the Tulare County Fruit Exchange has been changed from Visalia to Porterville.

Hanford is urging the establishing of a market day and place which will be an aid to those having produce to dispose of at that place.

Santa Clara Valley prune men are very hopeful over the early advance in the price of prunes. Indications at this moment are exceptionally good.

The latest section to take up the Wright irrigation system is La Grande in Merced county. The success of the Turlock-Modesto district is inspiring the movement.

The city of San Jose is discussing the plan of having that city beautified in its parks and roadways, the work to be in charge of Mulfred Robinson an eastern landscape architect.

The Pacific Sugar Company at Visalia is preparing to plant over two thousand acres of sugar beets during the present month and at least two thousand more during December and March.

Central California well wishers are discussing the formation of an organization to look after the interests of homeseekers to prevent their being fleeced by irresponsible real estate agents.

At a meeting recently of the stockholders of Lucerne Creamery Company at Hanford the following were elected directors: J. H. Dawson, J. C. Nesbit, M. J. Catano, G. A. Dodge and L. F. Burr.

Some growers of orange trees in door yards in Visalia who refused to have them fumigated, have been instructed by the commissioners to remove the tops and defoliate them or to fumigate.

Sacramento is reported to be contemplating steps for the removal of the State University from Berkeley to Sacramento. We presume this is in the nature of a joke, though we know that some people treat it as if Sacramento were in earnest in the matter.

Turlock irrigators are seeing the advisability of storage reservoirs to hold back the storm waters which they need in their late summer irrigations. The Journal says that a million dollars' worth of alfalfa could be grown additional if one more irrigation could be given at the end of the season.

Southern California

Plows have been started in many of the grain fields.

Celery shipments are going forward more rapidly than before the rain.

As a rule oranges are not so large this season as formerly at this date.

Thousands of acres of land were devastated by brush fire near Twin Oaks, San Diego county, recently.

A rain of an inch up to two inches, according to section, was visited upon Southern California the night before Thanksgiving.

Celery growers of Southern California appreciated the recent rain because of its being very beneficial to the ripening celery crop.

Special alloting agent for the Pala Indian Reservation has divided 3500 acres among the Indians; about 1000 acres of this land is irrigated.

At the present rate of planting eucalyptus, California will in a few years present a vastly different view to the tourist than it does today.

The acreage of apples in the Hesperia section in San Bernardino county will be increased this year by over 800 acres which will be planted.

While many cars of walnuts have been shipped from the walnut sections there are still cars stored in the warehouses. Possibly one-third yet remains.

Orange county will forward about 100 cars of celery during the month of November and about 500 each month during December, January and February.

The Brookings Lumber Company of Highland have withdrawn from the lumber trust and orange packing boxes are much cheaper this year than heretofore.

A new irrigation system which it is hoped will be installed within the next year puts some 10,000 acres of Hesperia land "under the ditch," much of which land will prove excellent apple land.

The proposition to have water conducted from the Laguna Dam above Yuma to Imperial valley lands direct instead of as it now comes, through the canal in Mexico, is meeting with opposition on the part of many.

The recent cool nights have caused more rapid coloring of oranges over Southern California. Some little concern was felt as to the cool weather being sufficient to damage the fruit but as yet the frost has not been sufficient to do any damage.

A portion of Southern California was visited by a severe wind storm last week. Some slight damage was done in some of the orange sections.

Southern Californians are making pilgrimage to Mount Wilson and other peaks for experience amongst the snow banks.

Ventura's harvest of beans has caused great happiness all over the county. The damage from the September rain was far less than anticipated. The beans now stored in the various sections are approximately as follows: Hueneme, 50,000 bags; Santa Paula, 36,000; Ventura, 85,000; Moorpark, 10,000; Somis, 65,000; El Rio, 86,000; Montalvo, 65,000; Oxnard, 110,000; Saticoy, 168,000; Camarillo, 138,000. It is estimated that about 12,000 bags are held by farmers for seed for next year.

The Coast

Oregon hay growers are shipping hay into California.

Oregon apple growers are making a display of their finest fruit in New York.

The State College at Pullman has recently established a course in Forestry.

The hop market at Portland is somewhat more satisfactory, the average price being about 7½ cents.

At the Idaho State Corn Show $25 prizes were offered to women for best products of the kitchen made from corn.

The lower valleys of Northwestern Washington have been injured by recent floods which have covered much farming land.

Umatilla county, Oregon, will send a strong committee or lobby to Washington to urge the continuation of tariff on wool.

Some fruit shipped from California into the port of Honolulu has been rejected and returned because of its being infected by "greedy scale."

The hop market at Portland was recently given quite a stimulus by heavy purchases which were made for a large water shipment; 8½ cents was paid.

A farmer of Spokane county, Washington, has topped the record with a yield of 800 bushels of potatoes to the acre. They were of the Burbank variety.

"A greater agricultural college at Whitman, Walla Walla, Washington," is a slogan which is causing great activity among the friends of that school.

Apple growers in Southern Idaho are concerned over "twig blight" similar to "fire blight" of the pear, which is infesting apple orchards of the entire section.

Prosser, Washington, recently had a mammoth meeting of farmers which was the first meeting of an effort to form a fruit growers' association for their own protection.

The wheat growers or farmers in the wheat belt of Eastern Washington have united in financing a new farm paper which is to stand for their interests. Its office will be at Pullman.

Next week the great apple show opens at Spokane. This is looked forward to by apple growers of the entire West as one of the greatest events in the history of the apple industry.

Planters of Hawaii are making energetic efforts to secure the improvement of her roadways. Owing to the rugged conditions great engineering problems have to be confronted.

Many extensive fires have been started in Hawaiian Islands by farmers clearing land by burning off the brush. The fire wardens have now served notice that serious punishment will be meted out to those who continue this practice.

Some apple growers of the Inland Empire claim they will take the $1000 prize offered for the best single specimen at the National Apple Show at Spokane with "Spokane Beauties," a new variety of apple which does exceptionally well in the Northwest.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used those machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Egg-More

is not a strong tonic and stimulant, but a highly nitrogenous, concentrated Poultry Food, very rich in protein. A little fed with good grains will keep hens healthy and make them lay lots of eggs. Have you tried it? Many have and are pleased. Here is just one:

F. W. Healy, the well-known banker and fancier of Pasadena, writes: "After hearing others praise Egg-More, I determined that if there was anything to keep hens laying through the fall and winter months, I wanted it. I bought a package of Egg-More and fed it and the improvement was very marked. Keeping on with it I soon proved the truth of your statement that 'you can't put all your eggs in one basket if you feed Egg-More.' I have raised poultry nearly all my life and for twenty years in California, but never did my hens lay so well as since I began to use Egg-More. I consider it the best egg producer on the market, and I do not intend to be without it."

You better try it. For sale by many dealers at 12½ lbs $1.00; 25 lbs., $1.90; 50 lbs., $3.60. If not by yours we will prepay freight on sack within 400 miles.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

CHICKEN CHAT.

Hens Die.

I have 400 hens, and am losing quite a few. They appear to be perfectly well, with red combs, but some die on the nests. I take good care of them otherwise, in feeding and in roosts. The pigeons and hens feed together. If you know of any danger, or of anything else that should make these healthy looking hens die, I would like to know what it is, and be very thankful to you.—An Old Subscriber, Hollister.

The danger of keeping pigeons with fowls is mainly from lice which pigeons are supposed to have in greater numbers than any other birds. And this alone should not cause the death of those hens in such a manner. Separate them, if you can, however, and see if it makes any difference, or fumigate the premises well. Dust the birds well with sulphur, and give half a teaspoonful of soda in each gallon of drinking water for a tonic.

Your hens may be eating nightshade berries or castor oil beans, both of which are fatal, and plentiful at this time of year.

Do they have plenty of good sharp grit? Do you keep charcoal before them? Do you supply green feed? In the answer of these questions you may find the cause of your loss; I hope so, anway. Examine the liver of one that has died, and if yellow spotted, or enlarged your feed is too concentrated, and a more bulky diet is indicated.

* * *

Turkeys.

My first experience raising turkeys was last year, and proved very successful. Out of 18 eggs I got 16 turkeys and raised all but two, and they died from accident. I now have a nice flock of ten hens and one tom, one I exchanged for one of my own hens. I want to raise all I can next year, but would like to know a few things so as to start right. My turkeys are six and seven months old, and are in excellent shape. How soon can I expect them to lay? I have seen the Tom with some of them. Would barrels around the pens do for nests? They have a large pen, and toward night I let them out so as to get all the green feed they want.

Could I use the first sitting of eggs to hatch from, and would you advise setting the hen turkey the first time she wants to set?

Could you suggest some cheap and convenient building to raise the young turkeys with the hen, so they can be sheltered from rain, and still be outdoors in pleasant weather?—A New Subscriber.

In the first place our new subscriber has done extremely well, and is to be commended for the study she has given her work, which is shown by the practical nature of her questions. In Mrs. Jones' Turkey Talk, I notice that she doesn't believe in using year-old breeders, as she thinks the turkeys from young hens are not vigorous, so I would suggest that the young from this mating be used for the table, and the old pen kept for several years mated as now. Turkeys at six and seven years old still produce well, and the young are easier raised from old, well matured parents.

Now, referring to this first question, I would suggest boxes without bottoms for nests instead of barrels; leave a board at the bottom of one side, the open side, removing the balance, which gives a box with three sides, one of which forms the roof. Some loose fine brush and leaves will make this an attractive place for Mrs. Turkey, as they like to lay their eggs on the ground, and will often cover them with the leaves, which is the way they do in the natural state. If barrels are more conveniently obtained, put a shovel full of sand, leaves, etc. By all means use the first sitting of eggs, which you may expect soon after mating, a month usually. Set the first clutch under chicken hens, and if the turkey wants to sit, turn her box over until she forgets it, which will be soon.

An ideal building for young turkeys can be made from a piano box laid down upon a couple of scantling to keep it off the damp ground, and one end made into a door, which should have at least one board removed and the space filled in with fine wire mesh. The top or roof can be covered with common table oilcloth, which will keep out the rain and protect from the sun as well. Part of a board should be cut out of the sides and a window put in, so the interior will be light and if the pane is set so as to slide, and screen wire tacked under it, additional air can be given. Keep the bottom covered with clean sand or chaff, and in wet weather they need not be let out for days at a time. A door at each end makes it more convenient to clean, and if a partition of wire mesh is put through the middle, two families may be accommodated under the same roof.

Little canvas coops can be made to do good service, also, if it is not found convenient to get the piano boxes, and some use buildings made of shakes with good results. Many are made of a frame of light lumber, covered with building paper (tarred roofing). To keep off the rain and wind is the main thing, and a shelter of blackberry bushes is about as nice a place for a run as can be found until the sunflowers grow. Sunflowers in the poultry yard furnish a fine shade, as well as many a choice morsel of seed.

The Cultivator would be much obliged if this correspondent would give us her method of feeding her young birds, as her success was a proof that it was a good one.—Mrs. Frank Metcalf.

WHAT IS UTILITY STOCK?

In the nature of the case, utility stock must be pure-bred stock. It is stock bred for practical qualities rather than mere fancy points, says a writer in Iowa Homestead. The arguments used to convince a farmer that it pays as well to have pure-bred fowls as pure-bred cattle and hogs, appeal to many of the ilk, but principally on the practical side. The better egg yield, the improvement in the appearance of the flock, and the better market values for uniform fowls are bringing the farmer into the ranks of the pure-bred poultry raisers. Very few farmers are fanciers in the strict sense of the term. Their duties are too many and pressing to give them time or inclination in this direction. As a rule, the man on the farm does not care whether a hen carries her tail at just such a mathematical angle, or has one or more points too few or too many on her

comb, if only she shells out the eggs, and is a good, large market bird. Exact shades of coloring do not bother him. What he wants is a flock of fowls that will prove profitable enough to pay for their own keep, furnish his table with eggs and chickens, and give a fair surplus toward meeting the grocery bills of the family.

But when he attempts to buy utility stock, what does he get? At a recent farmers' institute, after a talk on poultry by an intelligent woman, a man came to the speaker, saying: "I did not want to say anything in the meeting to oppose your talk, but I have a flock of pure-bred stock that has not laid an egg this winter." This was in February. Questioning brought out the fact that he had obtained his stock from a well-known fancier. This solved the problem, for the fancier in question was in the habit of selling the culls from his exhibition stock as utility birds, while they were practically worthless for that purpose. This was ruining the market for pure-bred poultry in that little town, for this flock of fowls was being closely watched for results.

The trouble seems to be that fanciers have one definition for utility fowls, while the farmer has a very different one. To the former it is apt to mean anything that is not show stock, while to the farmer it means well-bred birds that will produce eggs.

If the crusade for better poultry in the rural districts is to become effective, the farmers' definition must become the rule. He does not object to handsome, well-plumaged fowls, but they must be heavy egg-producers, or the fine feathers will go for naught. By emphasizing this point, the farmer and fancier will be drawn much nearer together, the fancier will find a far wider market for his output, and the farms will show a splendid improvement in the poultry line.

REASONS FOR THE DECLINE OF INDIAN GAMES.

First: They were wrongly named, giving fanciers the wrong impression that they were "scrappers."

Second: The classification which placed them in competition with Oriental Game Bantams, etc. They are principally of English origin, and should, and will, be placed in the English class.

Third: The departure from the true type. The breeders in following the idea that they were Oriental and that they were Game, insisted, persisted and succeeded in breeding them long legged, thus departing from the true Cornish type, which is short legged with short, broad back, and broad breast.

Fourth: The fanciers, fifteen years ago, did not realize that in Cornish they had one of the finest all-purpose fowls in existence.

"The True Cornish is a Grand Bird."

Now happily things are being changed through the untiring efforts of the American Cornish Club and the Pacific Cornish Club. People are awakening to the fact that the true Cornish is a grand bird.

We have them properly named now (Cornish fowl) and we are breeding true to type. We are going to have them properly classified, and by trap nesting we are building excellent egg producing strains.

To be appreciated, the Cornish must be seen. There are none to compare with them in luster of plumage, none to equal them in grace of carriage. They are the lords of poultrydom, and last, but not least, they are the finest table fowl on earth.

Get Your Share OF THE High Priced Eggs BY FEEDING Coulson's Egg Food

IT TURNS FAILURE INTO SUCCESS, by enabling you to secure eggs in the fall and winter while prices are high.

Improvements have been effected in the composition of the EGG FOOD during the past year so that it is now richer in the various nutrients required by the laying hen, and is a better feed than ever before. Proof of this is had in

Trap Nested White Leghorns

I trap nest every bird one year before I put them in my breeding yards, and no bird that has not made a record of 13 dozen or better per year as pullet is used. I cannot afford to breed neither can I afford to sell eggs from a hen that has not made this record as a pullet. I mate 15 hens to a well matured cockerel or yearling cock bird. My breeders have roomy yards, thus assuring strong fertility. A few choice cockerels for sale.

Eggs $1.50 per 15; $7.50 per 100; $60 per 1000.

300,000 Feet Water Pipe Cheap

ALL SIZES

150,000 feet of this shipment is second-hand pipe, practically as good as new, and is now on sale at a big discount by the Adams Pipe Works, 2025 Bay street. Sizes and prices: ¼-inch 2 cents per foot; ⅜-inch, 2 cents per foot; ½-inch, 2¼ cents per foot; ¾-inch, 3 cents per foot. 1-inch, 4¾ cents per foot; 1¼-inch, 6 cents per foot; 1½-inch, 7 cents per foot; 2-inch, 9¾ cents per foot; 2½-inch, 15 cents per foot; 3-inch, 19 cents per foot; 3½-inch, 24½ cents per foot; 4-inch, 30 cents per foot.

Oil well casing prices and sizes: 2-inch. O. D. 7 cents per foot; 2-inch, I. D. 9 cents per foot; 3-inch, 13½ cents per foot; 3¼-inch, 16 cents per foot; 3½-inch, 17 cents per foot; 4-inch, 20 cents per foot. All pipe is carefully inspected, new couplings and new thread are put on every piece, every joint is guaranteed to be first class, serviceable pipe. Mail orders promptly filled. To reach the Adams Pipe Works in Los Angeles, take car marked Pacific Boulevard, starting east on Seventh street from Broadway. Ask conductor to let you off at Bay street and go east half a block. Phones, F1917, Broadway 1264.

An extensive seeding of fall wheat has been made about Euphrata, Washington.

Cornish (Indian) Fowl

The bird for fancy and utility. If you want the best, I can furnish them, winners at England's and America's greatest shows. Eggs from my grand double-laced, low, blocky, imported birds, $5.00, $7.50 and $10.00 per setting. Pen headed by best cockerel bred from my imported birds, mated to American bred hens, $2.50 per sitting. Young stock for breeding and exhibition a matter of correspondence.

Remember, my imported stock is the best Brent could produce, are extra large, true to shape and color. Winners of all firsts at Los Angeles, 1907-08. Clean sweep at San Jose, 1908. Send for catalogue.

POULTRY SHOWS.

Petaluma, Dec. 16-19, 1908—Second annual exhibition Petaluma Poultry Show Association. H. R. Campbell, Secretary, Petaluma.

Pomona, Dec. 14-19, 1908—Second annual exhibition of Pomona poultrymen.

Fresno, Dec. 16-19, 1908—Annual Show of Fresno Poultry and Pet Stock Association. George R. Andrews, Secretary, Fresno.

San Diego, Dec. 29-Jan. 2—Annual exhibit, San Diego Fanciers' Club, J. F. Goforth, Secretary, San Diego.

Los Angeles, Dec. 30-Jan. 6—Poultry Breeders' Association of Southern California. Dr. C. S. Salisbury, Secretary, Monrovia.

FATTENING.

A good method for fattening fowls is given by a reader: Shut the fowls up in a dark place with just enough light for them to see to eat, and supply them well with grit and water. Corn meal, ground oats, cracked wheat and shorts mixed in equal portions should be fed. Feed them as often during the day as they will clean up food and bear in mind the importance of "stuffing" them. They should be fed after dark every evening, as well as very early each morning. Half a dozen fowls together will fatten more rapidly than a large number, and if it is practical to pen them off, six to a pen is the right number. Give no green stuff to these fowls, but rations of cooked potatoes, rice, corn bread, cracked corn and whole wheat may be given. Fowls crowded and stuffed in this way should be in fine condition in three weeks.

MITE REMEDY.

A. Y. Swayne, Chehalis, Wash., states in Northwest Poultry Journal that mites leave the hens before they get off the roosts, and congregate on the roosting poles in any crack or crevice that they may find and if no cracks or crevices are to be found, they collect on the under side of the roosts.

Paint the roosting poles and cross-pieces thoroughly with avanarius carbolineum once every three or four years and the mites will not trouble your fowls. This is a specific. I know this by having used it. I hang my roosts to the rafters by wires.

I have found avanarius carbolineum an infallible remedy for lice also. Painting the roosts as I have described above is all that I have done for pullets or old hens. For little chicks, paint inside of brooders, top, bottom and sides. For chicks with hen, paint inside of coops, especially the bottoms. It would be well if your brooder house is old to spray or paint the floors and walls also with avanarius carbolineum. As this is a wood preserver, it will be just the thing for new brooder houses for spraying floors and sides. Painting is better.

When taking hen off with chicks daub some of the paint on the hen in places where it will do the most good.

We get it here at the hardware stores. It is put up in one gallon cans and sells at one dollar and fifty cents per gallon.

The number of eggs produced is not affected by the presence of the male; but the average weight of the egg is increased.

DRESSING SQUABS FOR MARKET.

A half dozen or more squabs are hung on a rack at one time. The wings of each of them locked, which is done by drawing the wings closely together in the back, allowing one wing to overlap the other. This holds them firmly and causes no pain. The mouth of the squab is held open with the thumb and first finger of the left hand, the head and shoulders being held in the hand. With a knife in the right hand the blade is inserted through the crown of the head, penetrating the brain. At once the operator releases his grasp and allows the bird to bleed thoroughly before starting to pluck the feathers.

By the time about a half dozen of the birds have been stabbed, the first killed has bled sufficiently to be ready for picking. The squab is then removed from the rack and held in the hands while plucking the feathers. This method is said to be the most rapid, it being found that from 100 to 150 squabs can thus be dressed in a day by one good operator.

Some pigeon men believe in holding the bird while killing, but it has been proved that birds held do not bleed so thoroughly as when hanging, owing to the fact that the hand more or less compresses the fine veins, thus retarding the flow of blood. When a bird is not sufficiently bled it shows itself in blisters. These blisters are red splotches that form on the backs of the birds, and which develop by the time the carcasses reach market.—Petaluma Poultry Journal.

WHITE WYANDOTTES FOR THE TABLE.

The White Wyandotte is a good sized, blocky breed, well furnished with breast meat. Being small boned, their weight is in the meat, as compared with fowls of heavier frame. This variety leads for broilers and roasters, as they are hardy, the chicks grow fast and stand considerable forcing. Until the chicks weigh about a pound or a pound and a half, they grow very few feathers, their gain being in their plump bodies.

START WITH FOWLS IN PLACE OF EGGS.

It is generally conceded by poultry raisers that better results are obtained when starting with a trio of pure bred fowls than by spending the same amount of money for eggs.

Those who feed their hens all the corn they will eat should have fat, plump market poultry, but few eggs during the winter. From corn and meat the hen can produce eggs, providing the meat supply is plentiful enough to offset the lack of protein in the corn, but the expense of this ration is out of all proportion to the value of the eggs that can be produced. Wheat with a little oats and some corn is the best egg-producing grain ration. The three—composed of half wheat, one-fourth clipped oats and one-fourth cracked corn, can be used with safety throughout the entire winter, even though no other grain may be used. If a little meat and some clover or alfalfa hay is added to this, the hens should produce a plentiful egg supply throughout the winter.

One Kansas man says that with plenty of Kaffir corn to feed and alfalfa to scratch in, he will back any man in the poultry business. A certain amount of Kaffir corn should be fed to every flock, especially during the winter months.

General Agriculture

LIME.

"LIME sweetens the soil as generous deeds sweeten the soul." Above is a somewhat poetical statement of the fact vaguely recognized for two thousand years; but until comparatively recent experiments at Government Experiment Stations proved it to be a very valuable addition for many soils its truth was not fully appreciated. Probably the greatest advantage in the application of lime is secured on heavy soil. Here the double advantage of securing additional available plant food and improving the mechanical condition of the soil makes more apparent the advantage. This advantage is due more to unlocking plant food already in the soil and to improving the mechanical condition than to the direct addition of elements required by the plant. We believe that alfalfa is especially benefited by the application of lime, for as one grower has stated, "Alfalfa to do well wants a soil which has too much lime."

Professor Hilgard in Soils says: "A lime country is a rich country. The instant change of vegetation when we pass from a non-calcareous region to one having calcareous soils, has already been alluded to. But it is not necessary to be a botanist to see the change in the prosperity of the farming population as one enters a lime district.

Lime a Dominant Factor.

"When we investigate the cases of such lands, it soon becomes apparent that besides the low percentage of any one ingredient, the proportions of others present require consideration. Among these, lime in the form of carbonate stands foremost. Its presence exerts a dominant and beneficial influence in many respects, as is readily apparent from the prompt change in vegetation whenever it is introduced into soils deficient in it. In discussing the results of soil analysis, its consideration is of first importance in forecasting correctly the adequacy or inadequacy of other soil ingredients. For in general we find that lower percentages of potash, phosphoric acid and nitrogen are adequate, when a large proportion of lime carbonate is present."

Physical Effects.

Many clay soils when wet by rains are not porous enough to allow the water to pass through them with sufficient rapidity, in consequence of which they become water-logged and the aid which is necessary for the healthful development of plant roots within the soil is excluded. In times of drouth, also, such soils cake readily, thus becoming more difficult to till and less adapted physically to the growth of plants. Liming is an effective preventive or remedy for all of these unfavorable conditions. Upon certain loamy soils containing considerable clay, liming often renders the surface more friable and less liable to form a crust upon drying.

The improvement of drainage brought about by liming is one of the most effective means of preventing surface washing. When heavy rains occur on limed soils the water sinks into the soil instead of rushing over the surface, carrying the fine soil particles with it and thus producing galls and washes.

From Bulletin 183, New Jersey Agricultural Experiment Station, we note: "Of course there have been farmers wise enough to take up the use of the modern commercial fertilizer without at the same time deserting the use of lime according to the tradition of the fathers, but it is feared that many have been led away from the latter by the excellent results from the former. However this may be, the increased number of inquiries as to lime, which are being received at the station, indicate an awakening interest in the practice of liming. Land has become sour from the residue of fertilizers unused by the crops, or from other causes; the continual application of fertilizers, particularly muriate of potash, has consumed the lime originally in the soil, the crops using some, but the greater part leaching away; the advantages of liming acid or swamp ground have been shown and insisted upon by a number of experiment stations; the favorable physical effects of lime upon the extremes of soil—heavy clay and light sand—are recognized; the fact that lime unlocks the plant food of the soil has been insisted upon; modern investigation of the beneficial micro-organisms of the soil has demonstrated their need of an alkaline, or at least a neutral, medium in which to live and multiply; these are a few of the influential factors in drawing attention anew to the use of lime."

The chief impediment to the more extensive use of lime in the past has been the difficulty of spreading it in its lump form. In order to overcome this many agriculturists and horticulturists grind the lime, as in that form it can be spread in the same manner as commercial fertilizers. The grinding of lump lime, however, renders it peculiarly susceptible to "air-slaking" and consequently materially reduces its fertilizing and purifying qualities, as an "air-slaked" lime is practically a "dead" lime and more or less valueless.

In recent years a method of "processing" lime has been perfected which reduces the lime to an almost impalpable powder without, however, in any way detracting from the virtues of the lump lime. The product resulting from this process is known as hydrated lime and can be used for all purposes for which lump lime is used, it being particularly applicable for use as a fertilizer as well as a dry spray for the killing of insects on vines and trees.

SUGAR-BEET INDUSTRY.

Among many lines of work conducted should be noted the effort to build up new agricultural industries. One of the most important of the industries developed in recent years is the production of sugar from sugar-beets. More or less desultory work was done on sugar-beets as far back as 1867. In 1892 only six factories were in operation in this country, the combined output of which was a little over 27,000,000 pounds of sugar. For twelve years the department has consistently urged the production of this crop, with the result that there are now no less than sixty-four factories in operation, with a combined output of approximately 500,000 short tons of sugar manufactured from beets, with a factory value of $45,000,000. This industry has been built up by careful and systematic investigation, experiment and demonstration in the matter of increasing the percentage of sugar in the beet and the tonnage per acre, preventing diseases, and in other ways.—From October National Magazine.

Talking About
BOOTS

Perhaps the most acceptable Christmas gift for a young man would be a pair of our handsome high-laced Boots. If you will drop us a postal, we will mail you our No. 15 Catalogue, which tells all about them.

Our new Gymnasium catalogue is chock full of Christmas ideas, too.

Are you needing storm clothing or Arctic shoes for bad weather? Just mention it.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Possibly Blackleg.

I have one of the prettiest bunch of little calves you ever saw, in age all the way from five days to one month old. All Holsteins. They are dying rapidly. Lost five last week. They begin to droop and die in ten hours' time. They are plump and fat, eat and drink heartily, and before next feeding time may be dead. I do not think it blackleg, as they are too young. What is cure and preventive of this trouble?—O. P. O., Porterville.

This week's article covers at least part of this question. As to why these calves should die off like this I am not given enough information to judge. I certainly should have them vaccinated for blackleg at once.—M. E. S.

Peanut Butter.

In the last issue of the Cultivator I find a request, in the "Queries and Replies" column, for the method of making peanut butter. The nuts should be roasted until a light brown and so that the husks are easily removed. They are then ground in an Enterprise Meat Chopper, fitted with a finely perforated tin plate, which can be procured from any tinner. The plate should be made of tin having medium-sized perforations, and not the finest, and should be fitted on the inside of the strainer of the chopper.

Butter made in this way of almonds which have been blanched and dried or browned, and also from walnuts is preferred by some to peanut butter. In making walnut butter, however, care must be taken to remove every particle of the bitter husk which separates the parts of the kernel. A little of this goes far in flavoring the whole.—Mrs. C. U. Patterson, San Jose.

Pasturing Alfalfa.

I am in doubt whether or not it is the right thing to do to allow sheep to pasture on alfalfa fields during the fall and winter, when it does not grow tall enough to permit of cutting profitably. I am rather of the opinion that sheep injure it, in that they eat the crowns down too closely. Sheep owners are paying a good price this fall, but if it will lessen the crops next season we cannot afford to do it.—F. S., Arlington.

This was referred to Mr. Neff, who says:

It is always bad policy to pasture alfalfa, if the best results are expected from the alfalfa as a hay producer. Sheep are especially bad, as they crop the crowns close if allowed on the field long at a time. Pasturing by any kind of stock will thin out the alfalfa and allow weeds to grow, making the first crop of very little value.

It will pay you much better to sow about 40 pounds of barley per acre on the old alfalfa, in November or early in December, disk it in with the disks set nearly straight, going over both ways if it can be done without destroying the ridges, then harrow smooth.

If the ground is not wet enough to start the barley, irrigate before sowing. This will keep out all foxtail and make a crop of hay that will be as valuable as any other cutting, besides getting an early cutting that could not be had if much pasturing is done.

Grapes for Coast.

I wish to plant several hundred grape vines this spring. Am 2½ miles from coast. Soil is rather sandy. What variety should I plant, when is the best time, and what is the best method. I expect to sell to local market or ship.—E. M., Newport Beach.

If you have a clay subsoil, plant Purple Cornichon Rupestris St. George root. If the subsoil is comparatively heavy, the same combination is good. If your soil is sandy and dry to considerable depth, Golden Queen is a good variety.

Plant rooted vines in December or January.

Plant your vines 6x12 feet. This will give you convenient room to work and allow you 605 vines per acre.—J. W. M.

Price of Fertilizing Elements.

Kindly tell me through the Cultivator the commercial value of a fertilizer of phosphoric acid, nitrogen and potash.—M. M., Lakeside.

Such a question is impossible to answer in definite figures. The value of the various elements used in fertilizing our soil is influenced to a certain extent at least by the source from which they are derived. For instance, some think that nitrogen from stable manure or organic sources is more valuable than that from mineral sources like nitrate of soda. At least the effect upon the soil by the application of stable manure is far more beneficial than would be shown by mere figures as to chemical content of such fertilizer. Again, the market prices vary from time to time as with any other article which is bought and sold. A large fertilizer dealer of Los Angeles has given us the following as approximate prices which he uses as a basis of figuring in buying fertilizers in a large way. Bear in mind these are the wholesale prices, to which snould be added approximately $10 for each ton of fertilizer manufactured, as cost of mixing, grinding, selling cost, sacking, etc.: phosphoric acid, 6 cents; nitrogen, 16 cents; potash, 6½ cents per pound.

Gypsum to Remove Hardpan.

The Cultivator recently had a query regarding the value of gypsum to remove hardpan and asking how much per acre should be applied for that purpose. The letter was referred to the State University and we have from Professor E. W. Hilgard the following reply:

"Gypsum is effective in destroying hardpan only if it is the result of the presence of black alkali. Other hardpan has usually to be dealt with by means of dynamiting.

When there is black alkali in the land, the hardpan will usually be found at the depth of from 2½ to 4 feet. Anyone can easily determine whether or not such hardpan is due to black alkali, which can be cured by a dressing of gypsum, by putting a piece of it in water and covering it with gypsum. If it is the kind that is caused by black alkali, it will crumble to pieces within a very short time.

There are so many kinds of hardpan that it is difficult to say what shall be done with all of them in any brief time. The black alkali hardpan is the only one which cannot be effectively remedied, so far as tree culture is concerned, by means of dynamite blasts."

As to the amount of gypsum required it would necessarily vary with the amount of alkali in the soil to be overcome. It might be 500 pounds per acre, but most probably it would be a ton or possibly two tons.

Gypsum.

Is gypsum applied to the soil burned or unburned? What amount should be applied? Where is the nearest firm from whom it can be secured?—O. N., Fairfield.

Gypsum is applied to the ground unburned. The burned rock makes the cement and plasters which we use in our houses. The amount applied per acre depends entirely upon the results to be secured. If it is to correct an alkaline condition or change black alkali to white alkali it would depend upon the amount of alkali in the soil. It might be 500 pounds or several times that. It would also depend upon the purity of the gypsum. If it were 90 per cent pure gypsum it would require much less than if it were as is sometimes the case, only 30 per cent pure. The application of 500 pounds per acre on alkali land has given remarkably fine results.

We havn't the names of northern houses, but doubtless any fertilizer man may supply you. The Acme Cement & Plaster Co. of Los Angeles, can supply you.

Green Crops for Forage.

I wish some early winter forage or pasture for my cows and ask you to give information as to burr clover, vetch, cow peas or rape. Do you think sugar beets would be profitable and where is the nearest sugar factory to which I could ship?—W. D. G., Modesto.

Rape is perhaps the best of the feeds for the winter growing green crop. Cow peas would surely not grow during the winter season and vetch and burr clover are slower. Sugar beets would probably be profitable but you should make contract for disposing of them before planting that you may know exactly where your crop will be disposed of. As to cow feed, mangels will be better than sugar beets and give you vastly more bulk per acre. The sugar factories located at Crockett, Contra Costa county, or Alvarado, Alameda county, would be the nearest to your section—probably too far away for economical shipping.

Names of Vines.

Kindly give names and varieties of the two climbers of which I enclose blossoms. How may they best be propagated?—A. A. Henry, Rumsey.

The one with the flower of a deep rose color is surely a Bougainvillaea, and so far as can be judged by the flower after being somewhat faded in the letter, it is spectabilis. The other with the lilac blue flower is Solanum wendlandii. They are both reproduced by cuttings, the Solanum very readily. The Bougainvillaea you will probably have trouble with un-

less you understand growing plants from cuttings. However, by making the trial with wood of different size and ripeness you may succeed in getting well rooted cuttings. You may experiment at this season, but will probably have more success with cuttings taken toward spring.

Wool Batting.

Where can I secure wool batting to use instead of cotton in the making of comforts?—A Subscriber, Lankershim.

The wool batting may be had at any of the larger stores in Los Angeles or San Francisco, and possibly, of course, in most of the other cities. The very best grades are known as lambs' wool, which is very expensive. The ordinary carded wool in sheets may be had for about 75 cents and upward per pound.

Doesn't Come to Her Milk.

Another query is received this week from a Chico subscriber regarding a cow which fails to give milk of any quantity whatever after calving. We refer the subscriber to Mrs. Sherman's answer to the same query in last week's paper.

Imperfect Walnut Shells.

I send you sample of walnuts which have imperfect shells. Some of them almost no shell at all. The kernels are as fine as those of the perfectly-formed shells. Is there any remedy? They have had plenty of water.—W. B. G., Santa Paula.

This is a case of malnutrition so far as any one can judge. Some years it is a very perplexing condition. This year as a rule it has not been so bad. Walnut growers in the southern part of the State have urged the State University to take up and study the cause and remedy of this trouble, but the University has as yet been able to do nothing along that line. Practically the only method of handling such nuts is to crack and sell the meats.

An Imperial Valley

A REPRESENTATIVE of the Cultivator who accompanied the Southern California Editorial Association on its trip through the Imperial Valley in November wishes to acknowledge the hospitality of the people of the county visited, and also would especially mention the courtesy and care of Mr. Ingersoll, special representative of the Southern Pacific, who managed the train service so admirably as to permit the seeing of the valley in so short a time.

Within the next few weeks we hope to have for our readers articles and illustrations, as many as our space allows, telling of the alfalfa and stock industries, of eucalyptus culture, of the new developments in citrus planting, of various experimental crops now being tried, of the development in the various centers of the life of the valley.

* * *

Imperial Valley is a wonder land. Five years ago the Cultivator representative visited Imperial Valley and headed his write-up "A Trip to Invisible Cities." Then there was nothing to vouch for most of the cities but the fertile soil, the water and the faith of the people. Now the worst of the pioneering is over. The towns visited, Brawley, Imperial, El Centro, Heber, Calexico, Holtville, offer all the comforts of life in cities, and many of the luxuries. And there one gets what is often lost in larger, older communities, the warm-hearted neighborliness that in new places makes up for much of the luxury one has left behind. There is not a whiner in the valley, or if there is, the editors did not see him. The people of the valley admit it is sometimes very hot there, admit that some crops failed to bring satisfactory returns, admit that some mistakes have been made. Difficulty in getting their early fruits and vegetables to market is one of their greatest problems, but with additional railroad facilities and better organization among themselves they think they will soon solve that problem. Meanwhile, alfalfa and stock are safe and sure.

We talked to one woman who had lived in the valley five years, with only two weeks away in all that time, and she was well and contented. A man who recently moved his wife and three babies onto his new ranch thinks it the best move he has ever made. A workingman who has been there three years says the great trouble so far is that men take up too much land, more than they can care for themselves or hire care for: that 20 acres well farmed will support a man's family in comfort.

A real estate man says you can still buy land only four miles or so from town for $50 an acre, and proves to you that on a basis of crop returns the land is easily worth $300 an acre. They show you borings that prove that for 500 to 600 feet the soil formation is unchanged. They tell you for years the soil need be only scratched. They show you analyses of the irrigating water to prove that it replaces soil fertility faster than crops remove it. They are planting shade trees and flowers and building comfortable and pretty homes to live in. A year ago the only High School in the valley was at Imperial. Now every town has one, and yet in spite of this division of forces the Imperial High School has ten more students than last year. At Heber they have established a practical collegiate school. There is not a saloon in the county.

Pioneering days are not all over yet, especially out in the country, and the men of Imperial are the first to testify to the courage and devotion and bravery shown by the women of the valley, who have the hardest end of the life there, as in all frontier counties. But near the towns, when one sees the big touring cars, the well filled stores, the prettily dressed women, it is hard to realize that five years ago it was absolutely and literally a sandy desert, inhabited by coyotes and jack rabbits.

The people are the salt of the earth. Beside the practical farmer and the young man eager to get a start whom you find in all new countries, you find many University graduates, many business men who have come back to the soil for pleasure or health, men of note in the big cities of the East; you even find that every little village has some champion league base ball players on its team.

The Grand Canyon of the Colorado is one of the famous places of the world, and no one fails to be impressed by this stupendous chasm slashed and gouged from the earth. Here in the Imperial Valley, below sea level, under the burning sun, is all that immense alluvial drift carried down through the ages by the Colorado river as it slowly carved the magnificent canyon where the world goes to realize God.

This immense land here, once a desert and now through the foresight and labors of the pioneers the storehouse for the starving millions of the world, to the eye that can see and the mind that can think, is as wonderful and awe-inspiring as the mate-wonder place from whence it had its being.

BEAUMONT AWAKE.

For twenty years Beaumont has slept. The land company who started the town went into the hands of a receiver and only recently have its affairs been straightened out. Now that land can again be bought the town is going ahead fast. The climate is remarkably good, the air bracing, and the mountains all around superb in their beauty. The soil is fertile, and plenty of water has been developed. The little town is growing, and it has already many pleasant homes along its well laid streets and many most delightful people.

Wood Soled Boots and Shoes. Boots, $3.25; Shoes, $2.00. O. J. Weber Co., 858 South Los Angeles St., Los Angeles, Cal.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

"MARY HAD A LITTLE LAMB."

Mary had a little lamb,
Its fleece was white as snow,
And everywhere that Mary went
The lamb was sure to go;
He followed her to school one day—
That was against the rule,
It made the children laugh and play,
To see a lamb at school.

And so the Teacher turned him out,
But still he lingered near,
And waited patiently about,
Till Mary did appear;
And then he ran to her, and laid
His head upon her arm,
As if he said—"I'm not afraid—
You'll keep me from all harm."

"What makes the lamb love Mary so,"
The eager children cry—
"O, Mary loves the lamb, you know,"
The Teacher did reply;—
"And you each gentle animal
In confidence may bind,
And make them follow at your call,
If you are always kind."

• • •

It is seventy-eight years since the little poem, "Mary Had a Little Lamb," now familiar throughout the English speaking world, was first published. Probably more people know it "by heart" than can repeat the Lord's prayer. But how many can name the author? And this is a question open to dispute, for the authorship has been claimed by two persons.

The poem was first published in 1830 in a booklet of twenty-four pages, entitled "Poems for Our Children," and on the title page appears as author the name of "Mrs. Sarah J. Hale," who was at that time editor of the Lady's Magazine.

Mrs. Sarah Josepha Hale, who was a Miss Buel, was born in Newport, N. H., in 1788 and married David Hale, who died in 1822, leaving her five children to support. She turned to literature as a means of livelihood for herself and children. Her first effort was a few poems published for her by her friends. Then she wrote a novel, dealing with early American life, with the title of "Northwood." These attracted the attention of the owners of the Lady's Magazine, published at Boston, and in 1828 she moved to that city and began a successful and profitable literary career. Later in life Mrs. Hale moved from Boston to Philadelphia and took charge of Godey's Lady Book. She died in 1879. —Ex.

TRUE STORY OF A "BOY" YOU LIKE.

THIS is a true story of a little boy who began life, not so very long ago, right here in the United States, and is still living, although he has now grown to be a man. You have all heard of him, so my story is pretty close to home for every one of you.

This little boy began life with a very weak and sickly body. He was pale, with big teeth and big, near-sighted eyes, his arms and legs were skinny and spindling, and he couldn't stand the rough, hearty play that was so much fun for his brothers and companions.

Now, boys and girls, you know, who are like that, are too often mere lookers-on at the games, or put in their time reading stories or some other amusement that doesn't need a strong body. But the little boy I am writing about, although he was passionately fond of books, made up his mind that he would have just as strong and lively a body as any of his playmates. You see, he was a thoughtful little fellow, and this was about the way he talked to himself about his body:

"I am going to be a successful man. I don't want to take a back seat for any one. Other men have done things—big, strong, noble, useful, successful things—and I will, too. But, if I am to do anything worth while, I must have a strong, healthy body, because all the sickly men I know aren't much good. They haven't the strength even to try to do big things, and when they do begin, they often have to give up because they are sick. Besides, they are unhappy, and most always a great trial to their families and friends. So I have made up my mind to be strong and well, fit for any task.

"I have a body, just like the other boys, with arms, legs, hands, feet, chest, stomach, and back. I have a heart, lungs, digestive organs, liver, kidneys, brain, and nerves, just as they have. The only difference is that mine are weak, while theirs are strong. But I can make mine grow strong and vigorous by feeding them and using them. That is the way all the athletes do, and if they can, I can."

And so he did.

He studied himself and his needs. He read what men wrote who had long experience in making people's bodies grow strong. He found that he always felt much better when he spent a great deal of time out doors, instead of staying shut up in the house, as weak boys and girls are likely to do, especially if the weather is a little cold and stormy. By study, he learned that the reason was that his body was built very largely of oxygen, and that he had to get plenty of oxygen in order to build it bigger. Just as it takes a pile of bricks to build a brick house bigger, so it takes a lot of oxygen to build muscles bigger. And outdoors is the place to get oxygen. You see, the oxygen is a part of the air, and in the house there are so many people using up the oxygen, that there isn't much left for a boy or girl.

The next thing he learned was the bigger, deeper breaths he took, the bigger his lungs grew, the more air they would hold, and the more oxygen would go into his blood to be used in building bone, muscle, brain, and nerve. So he was faithful about his deep breathing, practicing it a great deal of the time when he was outdoors. Of course, he found that the straighter he stood, and the more he squared his shoulders, the more air he could get into his lungs. So he practised that, too.

Then, our boy found that he needed good, plain, wholesome, nourishing food, in order to become strong and well. He learned that his firm, white teeth were made to chew with, and that he had nothing in his stomach to do their work if they shirked, so he took plenty of time eating, chewing his food up fine before swallowing it. Thus, every bit of food eaten could be used by the stomach for building up his body. And there were no large pieces of food that could not be digested, and so would rot in his body, poisoning him.

Now with all the necessary materials at hand, he set out to build. And he built by exercise. That was quite a stunt for a little, weak-kneed fellow like him. It is all very easy for a big, strong, lively boy to exercise all the

time, join in the baseball, football, tag, run-sheep-run, and other games, and climb trees, swim, row, ride horseback, and box; but it is quite another thing for a little chap that was always getting beaten, at first. But he never lost courage, and never lost sight of the powerful man he intended to be. He knew that it is the man, boy, or girl who sticks to it who wins. He knew, too, that many of the hearty boys and girls who got ahead of him were so foolish as to think that, because they were healthy, they didn't need to be carful of their bodies. These, he knew, would finally break down, just as an abused machine does; so his chance was just as good as, or better than, theirs.

With all these things firmly fixed in his mind, and with an unwavering purpose to do what he set out to do, never doubting that he would finally succeed, our boy really did grow bigger, healthier, and stronger every day, until he became known all over the world as a man of marvelous health, vigor, and power of brain and body, an author, cowboy, city official, servant of the Nation, soldier, Governor of a great state, Vice-president, and, at last, President of the United States. Yes, you have guessed right, his name is Theodore Roosevelt.

Now I hardly think it necessary to point out the moral of this tale to our younger philosophers, but I do want to say to those who are not as strong as they would like to be, "Cheer up!" Have faith and courage. Make a firm determination, down deep in your heart, that you will be an able-bodied boy, a healthy, vigorous girl; then work hard at it, denying yourselves the idleness, the sweets, the too heavy meals, the cigarettes, and every other thing that might hurt you, and you shall win. And you fine, splendidly developed boys and girls, take extra good care of the great gift God has given you in your beautiful bodies. Just think what you may do with such a start as that, if President Roosevelt has done what he has with so poor a start.—Indian School Journal.

HOW LONG TO COOK VEGETABLES.

The time required for cooking green vegetables is as follows:

Green peas, young and fresh	15 minutes
Green peas, old and not so fresh	30 "
String beans	45 "
Lima beans, young	30 "
Lima beans, older	45 "
Cabbage, whole head and hard	2 hours
Cabbage, sliced	30 minutes
Cabbage, chopped fine	20 "
Cauliflower and broccoli	30 "
Cucumbers, cut into quarters	30 "
Squash, pared and cut into blocks	20 "
Tomatoes, peeled and cut for stewing	30 "
Tomatoes, baked whole in slow oven	30 "
Onions, young	45 "
Spanish onions, whole	2 hours
Spanish onions, cut into elghths	1 "
Okra	1 "
Green peppers, stuffed and baked	1 "
Green peppers, stewed	30 minutes
Celery, stewed	30 "
Spinach	10 "
Brussels sprouts, fresh	30 "
Kale	45 "

All white and underground vegetables are, as a rule, rich in woody fibre, which is softened by gentle cooking in soft water. As salt hardens the water, it should be added when the vegetables are partly done. The following table, if carefully followed, will be found satisfactory:

Potatoes of medium size should be boiled until they can be pierced to the center easily with a fork, which will require	30 minutes
Potatoes cut into cubes or balls	10 "
Rice, Carolina	30 "
Rice, Patna	20 "
Beans, old, soaked over night	2 hours
If for baking, cook until the skin easily cracks.	
Peas, old or split, soaked over night and cooked	2 "
Lentils, soaked over night and cooked	1 "
Sweet potatoes, medium size	30 minutes
Turnips, white, cut into blocks	20 "
Turnips, yellow, cut into blocks	45 "
Carrots, sliced or cut into dice	1 hour
Parsnips, cut into halves	1 "
Beets, new	45 minutes
Beets, old	4 hours
Salsify, sliced	45 minutes
Salsify, quartered	45 "
Artichokes, cut into slices	30 "
Asparagus	45 "
Green corn, after it begins to boil.	5 "

—Mrs. Rorer, in Country Gentleman.

HOMELY HINTS.

I use a small whisk broom in place of a dish-rag in washing dishes. It saves the hands and can be kept sweet and clean by scalding after using. I use the broom for the pans and kettles, as well as the china, and dry them on a towel kept for that purpose. This is especially helpful when one is obliged to wash dishes in hard or "broken" water.

To remove mildew, rub the article with soft soap, completely covering all the spots, then lay on the grass or hang up where the hot sun will strike it. In a few days wash out the soap and boil it. If you have missed any spots, repeat the process. This is a sure recipe and removed the mildew from a white dress for me when it was perfectly black with it and everything else tried was a failure.—National Magazine for October.

I do not use paper in my cake-tins any more; I grease freely with lard, put in dry flour and shake about until it has entirely covered the grease. Put in cake batter, and when it is done it leaves the tin easily without use of knife, and does not adhere in any place. You have no broken cake and no paper to peel off.

A SILVER FOX IS A RED FOX.

"The chilly autumn nights called out on him a deeper, richer robe of fur, and other powers, less comprehended, added gloss and color, intensified each day, darker and glossier, till every tinge of red and gray was gone. And those who observe such things might have asked, 'Is not this a foreshadowing of beauty yet to come? Maybe this diverse cub is predestined a silver fox!'"

In this manner Mr. Earnest Thompson Seton describes the change that came over "Domino Reynard of Goldurtown," the "hero" of his new serial of the same title, the first issue of which appears in the December issue of the "Century Magazine." The underlying motive of this fiction story is the "monogamous tendency of the better class fox." Continuing the description of the difference between a silver and a red fox, we quote Mr. Seton in part:

Only those wise in the woodlore of the North can fully know the magic in the name. The silver fox is not of different kind, but a glorified freak of the red race. His parents may have been the commonest of red foxes, yet nature in extravagant mood may have showered all her gifts on this favored one of the offspring, and not only clad him in a marvelous coat, but gifted him with speed and wind and brains above his kind to guard his perilous wealth. And need he has of all such power, for this exquisite robe is so mellow rich, so wonderful in style, with its glossy black and delicate frosting, that it is the most desirable, the most precious of all furs, worth many times its weight in gold, the noblest peltry known to man. It is the proper robe of kings, the appanage of great imperial thrones today, as was the Tyrian purple in the days of Rome. This is indeed the hunter's highest prize, but so guarded by the cunning brain and the wind and limb of the beast himself that it is through rare good luck more than hunter skill that a few of these fur-jewels are taken each year in the woods.

There are degrees of rank among these patricians. They range in quality even as diamonds range, and the hunters have a jargon of their own to express all shades between the cross and the finest silver black.

Forty Years

Forty years of experience—Forty years of steady upbuilding of business and reputation are behind every pair of the famous

KEEN KUTTER

Hay.

Because of the car situation, shipments of hay have continued quite active during the past week, the total showing 3820 ton in comparison with 3750 ton for the week preceding. All receivers of hay have been very firm in their ideas with the consequence that prices have been well maintained. It is now generally conceded however that the market cannot be maintained under a continuation of such heavy shipments so it is now generally reported that shipments have been ordered discontinued from many points.

The recent showers have also had a little tendency to discourage buyers so although prices are really no lower, yet at the present writing the market can be reported as being rather easy.

The discussion as to the future of the market owing to the apparent light stocks throughout the country still continues. Several operators are very strong in their ideas as to the future of the situation, maintaining that nothing can prevent a raise of from $3.00 to $5.00 per ton over the present range.

CO-OPERATION IN MARKETING.

Continued from Page 537.

Express shipments are only made to comparatively near-by points, and with such shipments the growers receive exactly what the fruit brings less the expressage and the association's commission. It is usually the early fruits that are expressed, but prohibitive rates prevent any very large amount of business being done in this way.

Such associations often fail in their purpose. The prime causes of failure are well summed up by Waugh, in the following manner:

All classes of farmers are constitutionally and proverbially distrustful of other people and of one another. In a fruit association there arise (such is the experience) the most inveterate jealousies. Each man thinks he is furnishing a better grade of fruit than his neighbor, though all share alike in the profits. Each one fears the other will reap some special advantage somehow. In particular, the appointment of managers, superintendents, supervisors of grading, shipping agents, and all other officials of the company offers a sufficient opportunity for the elaboration of all sorts of neighborhood quarrels. Each man thinks he ought to be manager, and when one man is finally chosen he is usually suspected of all sorts of favorism. In any case he is apt to be hampered in his business relations by committees, boards of directors and various kinds of red-tape and foolishness. Often he has to consult a committee before taking any important action.

Another difficulty which arises from the same cause is that subscribers to such an asociation never want to pay a manager's wages. Two or three dollars a day is considered good pay. Yet such a man is compelled at times to handle thousands of dollars' worth of business. The position is such as in ordinary business life would command a salary of $5000 a year or more.

Must have Confidence of Members.

Where such conditions exist there is little chance of success. They may be avoided to a great extent if inexperienced shippers will limit the size of their organization until the minor details connected therewith have been thrashed out. A few selected growers are sufficient to demonstrate to the community the advantages of cooperation, and a healthy expansion will soon take place. When the volume of business is sufficient to warrant such action, the management should be turned over to a man who is especially equipped with a knowledge of the details of marketing, and who has no crop interests of his own. He should receive the confidence of the members and be given a chance to work out his own ideas. The manager's salary should be adequate for the work and responsibility involved. It is sometimes the custom to give him a percentage on the total amount of business transacted. Well-established associations, however, can afford to pay a good manager a straight salary and thus feel more certain of retaining his services from year to year. The Colorado bulletin, previously referred to, contains a report of the Grand Junction Fruit Growers' Association, which "is the oldest and is doing the largest business of any in the state."

A Successful One.

This association was started in 1891, when a few growers combined and appointed one of their number salesman of their fruit for the season. This arrangement continued with varying success up to 1897, when it became apparent that the increased business, if no other cause, would necessitate employing a manager by the year, who should devote his entire time to the association. Accordingly, this was done, and the business has increased year by year. That the majority of the stockholders are satisfied with the workings of the association is proven by their loyalty and by the fact that the capital stock has recently been increased to $100,000 for the purpose of accommodating the increasing number of members.

WINE GROWERS NERVOUS.

Continued from Page 536.

necessary appliances. Should the prohibition wave gain headway and include wine among other condemned beverages it would spell ruin to many Californians. It is the fear of this that is causing our winemakers to hedge and trim their sales for a possible coming storm. As a result, there has been a poor demand for wine grapes this season and prices have been lower than in the past ten years, as low as six dollars per ton being paid. Very much less wine will be made than usual this season and both growers and makers are already feeling the result of the temperance wave in the East, in their uneasiness as to the future. Hop growers are in somewhat of a like condition, and hop prices are so low that many of the yards in the Sacramento valley will be plowed up in the spring and planted to other crops.

This is a good time of the year for a person to enjoy reading nursery catalogues which are being put out in greater numbers than ever this year. The latest to reach the Cultivator table is that of the Fresno Nursery, with main offices at 928 I street, Fresno, Cal. The catalogue is not exceptionally large, having forty pages, but is full of information and descriptions of many varieties of commercial fruit.

Accompanying the catalogue is the 19th annual price list, giving the prices which will prevail upon all plants for the coming year. It may be had for the asking by writing the Fresno Nurseries, Fresno.

Pink Cherokee Rose.

A FINE PAMPHLET.

The illustration of the pink cherokee rose on this page is from the beautiful 50 page catalogue of the John S. Armstrong Nursery of Ontario. Mr. Armstrong's catalogue last year was spoken of at the time as a very strikingly attractive one, but it is excelled by his effort this year. The cover is not the flashing red of last year, in fact is much more subdued; but with it all the tasteful cover design makes a most attractive booklet. In its contents, especially as to its illustrations, it is much more complete than last year. Of course one of the strong points of the book is the complete list of orange trees which Mr. Armstrong offers for sale, prices being given in every instance, and full description of each variety. In deciduous fruits Mr. Armstrong has a bigger collection than ever before. In the ornamental department, of course the rose, which is one of Mr. Armstrong's specialities, has the greatest number of pages; and some beautiful illustrations give added value to the rose department.

SOMETHING NEW.

The Success Incubator catalogue that is being given away by the E. E. McClanahan Incubator Company, 112, East 8th St., Los Angeles contains the most interesting poultry and chick lectures ever written. These are written especially for this book by the best writers in California today and apply to conditions here and not to eastern conditions as most books refer to. This book gives complete description of the famous Success incubator and brooders. These machines have gone to the front rapidly and where ever used more follow. By sending your address on a postal card the book will be mailed free to you if you mention this paper.

The State Fruit Growers Convention

A Good Meeting is Held at Sacramento. A Short Account of It in This Number. The First State Convention Was Organized in Sacramento 27 Years Ago

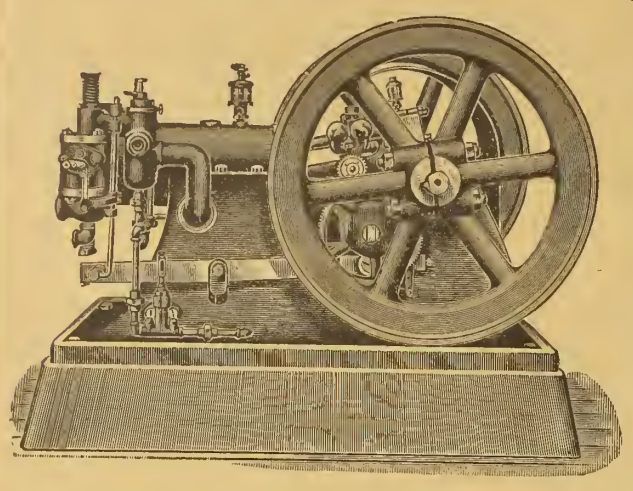
Courtesy Sacramento Chamber of Commerce.

CALIFORNIA may well be proud of her State Capitol. Beautiful in outline and beautiful in its immediate surroundings of forest trees brought years ago from all parts of the world.

It is on these grounds, covering some 15 acres, that the State Insectary described on another page is located. It is on these same grounds that the old state fair pavilion was located. We say "was" for now all that remains of that mammoth structure which has been the center of state fair work for many years, is a great pile of broken timbers. In another few weeks they will be removed and trees and shrubs given a place where it stood.

It is said that no country of the world is without a tree to represent it on the Capitol Grounds.

Alamo Gas and Oil Hoisting and Stationary Engines



Best in price, appearance and quality. Self-starting and small operating cost. A complete line of repair parts and accessories always on hand.

Complete pumping plants installed and we are prepared to construct all kinds of mining machinery on contract.

Harrison Machine Works 719-721 N. Main St. Los Angeles, Cal.

"XXX" (TRIPLE STRENGTH) Squirrel Poison GOPHERGO

"XXX" is superior to any squirrel poison sold because it:—
Has three times the strength.
Has the poison IN the grain, not ON it.
Will not weaken with age or rub off.
Is sweetened and scented.
Is thoroughly dried and will not mould.
Will go farther and act surer.
Is guaranteed.
Sold in bulk in any quantity.

"Gophergo" is a sure exterminator, and will kill ten gophers where traps or other devices kill one. Small cost and no trouble to apply.

Sold everywhere in cans, 25 cents to $2.50

We make a business of exterminating gophers and squirrels, and can save you time and money. Write to us.

Thirty-Fifth Fruit Growers' Convention

The State Organization Holds Sessions at Sacramento, at Which Many Valuable Papers Are Read

IT is easy to say that the dominant note running through the Thirty-fifth State Fruit Growers' Convention which closed last Friday in Sacramento was voiced in the answer to the question "How can we market our fruits?" That question was liable to be sprung at any moment. During the discussion of the question of humus which was led in an excellent paper by Prof. Shaw, this question again came to the front in the form of "If we cannot market our fruit at a living price what is the use of our discussing soil conditions?" So, while there were practically no set papers or addresses on co-operation we believe that one thought which continued to be sprung the oftenest was that one question.

The reason for it was, of course, that that thought is uppermost in the minds of those attending, and besides it was touched upon at some length by State Commissioner Jeffrey, who was, of course, President of the Convention, in his annual address. On this point Mr. Jeffrey said:

Part of the President's Address

"The farmer is not up-to-date in all the departments of his pursuit. He has not considered it within his sphere to create, control or even influence his selling agencies. On the contrary, the manufacturer has not neglected this most essential matter. The farmer has not created the demand for superior service in merchandizing his crop and consequently the make-believe methods of our commercial schools speak only in the language of the factory and county house. And this condition will prevail until finally a chair of farm economics will be established in all our universities and schools.

"No question is more important than that which ..as been the theme of this address, namely, the getting down to fundamental principles in the handling of fruit markets. This involves a study of transportation, of the distribution of fruits and of carrying the risk of getting your fruit to the consumer, for this always falls upon the grower.

"I have tried to show you the folly of going forward in producing more and better fruits and not providing for their disposal. I have intimated that if we do not delve into the economical problems affecting our California fruit markets, overproduction is already upon us. Let the members of this convention lead in discussing these difficulties and join all the fruit growers in their prompt solution, recognizing the burden of this address, that they will be at the mercy of all circumstances adverse to rural progress till they learn to secure their portion of the profits of horticulture."

In the quality of the addresses and in the excellent program and possibly in results accomplished we do not believe any previous State Fruit Growers' Convention has excelled this one. In attendance, especially of local people of the producing class, there was a marked lack. Sacramento people from the various business houses occasionally dropped in but Sacramento county farmers could almost be counted on the fingers of the hands. The Southern California delegation was large and took active part in the program.

The meetings of horticultural commissioners from various counties of the state brought to the convention large numbers to discuss with the fruit growers as well as for special meetings of the commissioners to discuss methods of enforcing the present law more rigidly and of securing, if possible, the enactment of new laws which would accomplish the desired results for the fruit interests. In fact Tuesday evening brought forth the very interesting discussion that was characterized by some slight manifestations of heat. This was occasioned by the resolution presented by Harry P. Stabler of Yuba City which called for the maintenance of the present horticultural laws, especially with reference to three members being required on each horticultural commission.

The movement had been started to secure the passage of a law reducing the number of commissioners to one who should have entire and absolute control of quarantine interests of the county. This movement is especially urged by nearly all Southern California commissioners. The working out of the present law in the hands of northern counties has been so satisfactory however that almost the entire northern end of the state opposed the move.

The South has found the working out of the present law very expensive. For instance, Los Angeles county at the present time is spending about $12,000 a year on its horticultural commission Riverside county, practically the same. In San Bernardino county, while it has a three-man commission the active work is done by one meember, Mr. Pease, and hence is not so expensive to the county. Many of the northern commissioners evade the expensive feature of the present law by appointing three commissioners, two of them consenting to fulfill merely honorable positions while the active work is done by the third who draws all the salary. Santa Cruz and Monterey county combine and together employ a county entomologist who takes practically the same power as the horticultural commissioners although in the same counties commissioners are appointed, at least this is true in Santa Cruz county where

Tulare County Oranges and Lemons

A Fine Exhibition of Citrus and Other Products of Central California at the Tulare County Citrus Fair

ALL Central California in general and Tulare county in particular had a jolly gathering at the Tulare County Citrus Fair which was held in Exeter last week. As an exhibit of the products of that section it was satisfactory, and as an occasion of gathering together all the people it was equally so. The older people visited in the pavilion where the exhibits were made or in the machinery annex at one side, while the younger enjoyed the afternoon in sports at the grounds only a short distance away. Each evening a special program was rendered, different communities having charge on the different evenings. The principal exhibitors at the fair were the communities of Porterville, Lindsay, Exeter, Lemon Cove and Dinuba.

This is the third annual exhibit of the Tulare County Association. The first was held at Porterville, the next at Lindsay and now at Exeter. The association holding the fair is to a certain extent a permanent one, but the direct management each year is in the hands of a local committee appointed by the Board of Trade in the town in which the exhibit is held. Financially, the fairs have been ordinarily successful though the first one held at Porterville was somewhat short in

Save Time--Save Fruit

With the Brewster Picking Sack

A new method sack—invented and perfected by lifelong growers. Eminent orchardists pronounce it perfect. Those who have tried it say they would not be without it. Actual tests show that a man can pick twenty-five per cent more fruit with it and with greater ease.

Sack forms semi-circle about picker's body—is supported by straps over both shoulders and held tight by belt around body. The picker can thus work with ease either on ground or ladder. When full, it does not extend below the hips.

A great feature of the Brewster Sack is the patent gate (see illustration), WHICH PRACTICALLY ELIMINATES BRUISING. Simply unfasten a hook—the gate drops—and the fruit can be quickly but very gently poured out.

The sack holds as much fruit as the old style sack.

Made in two grades.

Regular picking sack grade, sent express prepaid for $1.50.

Special extra quality—that will outlast two ordinary picking sacks—express prepaid $1.75.

Sierra Madre Sack Company - Sierra Madre, Cal.

We want reliable men in every locality to demonstrate this sack and act as our agents.

FUNGOUS DISEASE OF SCALE.

FLORIDA is succeeding in fighting white fly and scale with fungous diseases. Probably such remedies will have little or no value to California fruit growers, it is interesting to learn of their methods as given in Bulletin 94 of the Florida Station from which we quote:

Favorable Conditions in Florida.

Nowhere else in the world have fungous diseases been employed to combat scale insects and similar pests to so large an extent as in Florida. This is largely due to the fact that our climatic conditions are especially favorable to the spread of fungi. In an arid or semi-arid region to use these species as natural enemies for combating our pests would be entirely in vain. It happens, however, that Florida, in addition to having an abundant rainfall, has also a moist atmosphere.

The use of fungi and bacteria to produce diseases of insects has been advanced from time to time as a means of repressing these pests. The conditions, however, under which many species of insects live are such as to make it a difficult matter to apply the remedy. Wherever insects occur that are gregarious in their habits, the disease method of combating them can be used with advantage. This has been repeatedly proved by the success that has been attained in destroying the chinch-bug of the wheat fields and corn fields of the Northwest. While the climate there is ordinarily too dry to permit fungi to flourish, the wheat plants and corn plants in their growth give off enough moisture to make the atmosphere in the fields a rather moist one. It thus happens that rather unnaturally we have a moist condition in a field situated in what is usually a dry region.

Many species of scale and similar insects in Florida suffer great annual diminution from fungous diseases. This can be readily proved by simply treating a scale-infested plant with a fungicide, such as Bordeaux mixture, which will then destroy the fungi that kill scale insects, and a great increase of the latter will ensue. That there are still many undiscovered species of fungi which attack these forms of insects is clearly shown by the fact that within the last year three species of fungi have been found to attack the white fly, which heretofore had not been known to be enemies of this pest.

Scale Fungi do not Attack Trees.

It is frequently asked whether it is not dangerous to introduce these fungi into an orchard, the questioner fearing that when introduced they might produce a disease of the trees, or attack the fruit. No such dangers need be anticipated from any of the scale-destroying fungi that we have so far discovered. As soon as these fungi have destroyed the scale insects and other pests upon which they live there is no more food for them to exist upon, and consequently they must perish. One of our best orchardists, having extensive orchards in the state, has frequently said that he would prefer to have always two or three scale-infested trees in the orchard. As long as he had these scale-infested trees he was sure of knowing just where he could put his hand on fungous material to keep down scale insects in the other trees. Of course in a short time the trees that were originally scaly would become entirely free from scales, and he would have to look for fungus in other places. The same speaker stated that one among the many regrets he had after the great freeze was that he had lost not only a considerable amount of well-grown wood from his trees, but had also lost all of his friendly fungi; and that he would be somewhat perplexed to know just where to get these fungi again to protect his trees against the scale insects.

It is nearly certain—one might say almost beyond question—that for the most part the diseases of scale insects and white fly are native to Florida. While this cannot be stated with absolute certainty, still the fact that the different fungous diseases appear spontaneously in widely-separated orchards of the state rather confirms one in this opinion. In addition to this, quite a number of the fungi which attack scale insects have been found on trees growing near hammocks in localities where it would not be probable that they could have been carried from cultivated orchards.

Care Necessary for Success.

To control scale insects and white fly by means of the fungous diseases one must pay close attention to minor details, and must make intelligent observations. It is as impossible to carry out this work successfully without due regard to the needs of the fungus and the peculiarity of the insect pest that is to be controlled, as it would be to use insecticides with the same disregard to details. The writers have frequently met orchardists who have pinned in a few leaves bearing white fly diseased with fungus, and who in six weeks had actually forgotten where these leaves had been pinned. In some cases the orchardists expect the fungus to be disseminated to all parts of the grove after simply tying a few sprigs of such fungous material in one tree. For such work to be effective it would be necessary to make close observations of the entire orchard; to find where the greatest amount of scale or white fly was located, and to introduce the fungi in such positions as would give the best opportunity for the spores to spread from one limb to another, and from one tree to another.

It sometimes happens that orchards become very badly infested with scale insects before one is aware of the fact; or, stating it in other words, the orchardist becomes careless and neglects to make observations in his field as frequently as he should. When such a condition has arisen, especially in connection with recently-planted or scattered trees, it will be best to relieve the condition temporarily by spraying with some contact insecticide—such as whale-oil soap or kerosene emulsion. This will give the trees relief by reducing the amount of scale present; and as soon as the insecticide has disappeared the fungi may be introduced.

Imperial Valley Collegiate Institute is creating much interest among the farmers of Imperial valley and it is hoped it will prove of great value in educating the young of that section as to agricultural conditions and the best plan of meeting them as they appear in the Imperial valley.

Deciduous Fruit Culture

By J. W. Mills

IMPROVING VINEYARD SOILS.

IN our last number we referred to the hard and unfriable condition of vineyard soil in many sections of Sacramento Valley. These particular soils are naturally inclined to break up into clods which become very hard when dry. This has always been the case to a greater or less extent, ever since the land has been used for plowing purposes. Land that was once heavily timbered and cleared for agricultural purposes was for a number of years very productive and easy to get into a friable condition, as compared with adjoining land which had been cleared and brought into cultivation years before. The reason of this is that the humus produced from the rotting of the twigs and leaves is soon used up by the growing crops and is also converted into the universal elements of the soil. This leaves the soil devoid of humus, and the richest soil without humus is a poor one.

The Importance of Humus.

A soil analysis that does not take into account the humus content will not indicate its agricultural value. An interesting experiment was once made at one of the experiment stations. The horticulturist wished to satisfy himself on the much disputed question of soil analyses and took three samples of soil to his chemist. One sample from a naturally barren clayhill, an adobe brick and some productive garden loam were used. The garden loam was the poorest in mineral plant food, but full of humus. The adobe brick and yellow clay were the richest in plant food but devoid of humus and consequently non-productive. Here was a lesson that should be heeded by all tillers of the soil. The results obtained from stable manure are almost always credited to the nitrogen given to the plants by it. It is true that much of the increased growth is due directly to the mineral fertilizers contained in the manure, but there is an after effect due to the improved physical condition of the soil. This shows up several seasons after the soluble minerals contained in the manure are leached out.

The Action of Humus.

Humus increases the absorbant properties of soils and retards the capillary action of water and thus it is that soils rich in humus retain their moisture much longer than others. If a small cube of soil containing humus is placed under a microscope small particles of fiber can be seen. This is vegetable matter being converted into humus. This fibrous material holds the particles of fine heavy soils slightly apart and prevents their sticking together and thus it is that the soil water cannot travel so fast from one particle of soil to the other and come to the surface and evaporate, which process is the capillary action of water in soils. In light sand soils, humus has a binding effect and prevents the too rapid passage of air through the soil and for this reason the soil water is not so rapidly carried off as it would be in such soils devoid of humus. Humus in the pure state will absorb more water than any soil and when incorporated with the soil it does not lose this property.

The decomposition of vegetable matter produces humus, and while this process is going on acids known as humic acids are produced, which act upon the insoluble mineral plant foods, liberating them and thus enable otherwise barren soils to produce good crops. It is known that 50 per cent or more of the available plant food in soils is found in the humus. Is it not, therefore, important that humus is abundantly supplied to the soil?—J. W. Mills.

APPLE PACKING

Claude I. Lewis, Professor of Horticulture at the Corvallis Station, gives the following advice on packing for any paying market. When a local market is dull or sluggish, it might be advisable to send in a box or two carelessly packed in contrast with a larger quantity of fruit shipped at same time by same party in first class style, as the following describes. The seller will find less difficulty in getting a good paying price for his best when the fruit is placed in visible comparison with the inferior grade and pack offered at a less price, provided the owner or his representative can be present at the selling.

The Box.

In buying boxes select the best on the market. Cheap boxes are often worthless. You will need two sizes. The standard box has the following inside measurements: 10½x11½x18. The special California box measures 10x10x20. It is an advantage to have both sizes as some apples do not pack well in the standard box but will pack very nicely in the special. These boxes should have three-quarter inch material for ends, three-eighth inch for sides and quarter inch for top and bottom. Experience has shown these measurements to be the best to avoid splitting and bruising of the fruit and to allow for necessary elasticity.

Paper.

Next you need a good supply of paper. Lining paper should always be used on all good grades of fruit. It requires two sheets for a box. This paper is very light in weight. If using the boxes of both sizes remember this in placing orders for lining paper. This paper assists materially in keeping fruit clean and in taking up surplus moisture. Layer paper should also be used. This comes in two sizes and is very valuable in soaking up any excess of moisture that might otherwise assist decay. This paper should be used in the bottom and top of the box and between the layers. Wrapping paper should be obtained. The 8x10 size is the more commonly used. This paper aids one in putting up a solid pack and protects the fruit from bruising, slipping, etc. Experiments conducted the past two years at this Station have shown conclusively that fruit that is wrapped keeps much better than that which is not. Again, when the paper is used it conveys to the buyer the thought that he has a superior article.

Other Necessities.

A good supply of nails should be obtained. The cement coated are very satisfactory. Some prefer the twisted nails. Never use poor nails, as it may mean the loss of the fruit. Where a large amount of fancy fruit is used it is a very good plan to use a lithograph label of your own. This advertises your fruit and generally pays in the end.

You should also supply yourself with rubber stamps. Have one stating that the fruit is grown and packed by yourself. This covers the state law and also is an additional advertisement. A stamp is needed for each tier—3, 3½, 4, 4½ and 5. The number of apples contained in the box should always be stamped on. You will need the following: 45, 54, 64, 72, 80, 88, 96, 104, 112, 128, 150, 165, 175 and 200. Stamps like "choice" and "fancy" can also be used to advantage. If a number of packers are to be employed it is well to give each a number and have him stamp every box he packs.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths, Fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials

(For 20 Years the Fertilizer Man)

FRUIT GROWERS' CONVENTION.

Continued from Page 555.

the commission is entirely honorary and advisory.

Mr. Pease of San Bernardino finally presented a resolution which did contain much that the southern end of the state was appealing for, and that is the lifting out of politics of the appointment of commissions and putting them under civil service rules. In effect his motion was that the convention recommend to the legislation committee that a horticultural commissioner before appointment should pass some sort of an examination which would show him to be qualified not only as an active fruit grower, but by education and experience to judge on entomological and plant disease questions. This motion was finally voted upon, with the result that 33 voted for and 7 against.

O. E. Bremner of the State Commission put the entire convention in a most amiable mood by his humorous observations of the work with the demonstration train which toured the Sacramento Valley.

Insectary Dedication.

Wednesday afternoon occurred the dedication of the State Insectary, which has just been completed and the insects, many of them, installed. This insectary has long been the need of the state, especially so since the partial destruction of the former collection which was in the Ferry building at San Francisco at the time of the earthquake.

A very attractive building has been built on the State Capitol grounds near where the old pavilion stood, which is fitted in every way to properly test out and breed beneficial insects which may be brought to this country from others.

Mr. E. K. Carnes is in charge of and has general supervision of the construction and installing of the colonies of insects. At the entrance the visitor is confronted with a large exhibit of all kinds of insects in cases, well worthy a day's study by the up-to-date fruit grower who might wish to post himself as to insects both injurious and beneficial. Opening off from this room is the court filled with various plants which is entirely surrounded by the propagating rooms. These rooms are all supplied with steam heat, so that the attendant may regulate the temperature day and night, year in and year out. These rooms are nearly all filled with insects which are now being bred ready for distribution to the various sections of the state.

The address of dedication and tribute to Elwood Cooper, founder of the Insectary, was to have been made by State Senator Estudillo, but in his inability to be present, Mr. James Mills of Riverside was called upon for the address, which was largely a tribute to Elwood Cooper's work in the interest of horticulture of this state. At the entrance or approach to the steps is a marble slab imbedded, "Founded by Elwood Cooper, 1907."

In his tribute, Mr. Mills said: "In being called, in a measure, to express a tribute to so great a man as Elwood Cooper, a better voice than mine ought to be heard. There are all too few of the citizens of this state, and of other states, who are like-minded with Elwood Cooper, who are willing to give of their lifetime, of their younger days, of their mature days and of their advanced years, years of work when others are seeking rest and leisure—I say there are all too few men like Elwood Cooper who, through many years, have given to horticultural interests of this state the very ripest of their talents in the service of the fruit growers and the agricultural people of this great state."

A committee of five consisting of Messrs. Carnes of Sacramento, Maskew of Whittier, Pease of San Bernardino, Cragg of the San Joaquin Valley and Messenger of Los Angeles were appointed to unveil the tablet.

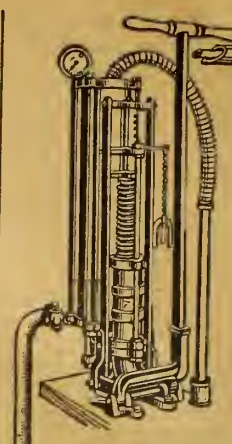
CONVENTION NOTES.

The addresses and discussions which followed them were many of them worthy of almost the whole issue of the Cultivator, and will be the source of many an instructive article later. The fact that most of the speakers' names are not even mentioned in this issue is no indication of lack of worth



This is the Pump

that can be operated continuously at high pressure without the muscle-racking, exhausting, "man killing" exertion required for ordinary pumps. High pressure spraying means more and better fruit—and consequently more money for the grower.

Bean Magic Spray Pumps

are different from other pumps. They run smoothly and easily without clogging, and one man keeps up high pressure for two lines of hose. And they **save one-third the labor.** The Bean patent spring does it. The operator does half the work at each stroke of the handle, and works against but half the pressure indicated on the gauge. A trial quickly removes all doubt.

Our illustrated catalog No. 21 describes ten sizes of handpumps, and contains much valuable spray information, and formulas. Catalog No. 18 describes Power Sprayers. Both books sent free. Write for our special offer; state number of acres and kind of fruit.

of what was said. The one question of space alone prevents even mention of the good things of the convention.

Mr. Dartgitz of San Joaquin county maintained that labor people were all organized; the railroads all have a "gentleman's understanding;" the big packers and shippers are reasonably close to a trust condition; but the farmers never seem able to get together. He was reminded that the orange growers of the South had succeeded in a most complete organization which had been successful for a period of over 15 years. In fact, the California Fruit Growers' Exchange was held up as a model of co-operative marketing which many others would be wise in following.

The suggestion of Mr. Bowen of Los Angeles was that it would be to the interest of the state in general if a building were constructed on the land formerly the property of the 6th district Agricultural Fair Association in which exhibits might be made by all sections of the state which would show agricultural possibilities and give to visitors to the southern end of the state an idea of the productiveness of all portions. As a rule Sacramento and San Joaquin counties favored the move believing it a good opportunity to put their exhibits in a permanent form.

E. F. Adams, agricultural editor of the Chronicle, gave a most interesting paper on the history of the free market movement at San Francisco, describing it as one of the principal ones to push this marketing venture to the front and work earnestly to secure it. The paper was somewhat in the nature of a confession of the fact that he was unable to do politics sufficiently swift to win out in the face of work done by large steamship and railway interests.

Another resolution which was not so unanimously accepted and called for very strenuous discussion was the one relating to reciprocity arrangements with Canada. This called for "such trade relations as Congress may deem wise which might secure the introduction of California prunes and other dried fruits to Canada without payment of duty." The idea expressed by protectionists and others who opposed it was that our efforts should be to secure the present or higher tariff on our fruits without calling for reduction of manufactured or other articles as an offset for the desired advantage to us.

Another discussion which called forth some good hot stuff was the charge by Prof. Chase that Johnson grass seed had been introduced to this state by the San Francisco Bulletin in a free seed distribution. Mr. Rixford, for many years business manager of the Bulletin but now connected with the Department of Agriculture as special agent, promptly denied the charge saying that the Bulletin had never for any purpose introduced any Johnson grass seed. Be that as it may, it was plain from the talk on the floor of the convention that Johnson grass is becoming one of the most serious pests and a menace to all lines of agriculture. The only remedy recommended was a continuous and clean cultivation.

The reception tendered the delegates at the Crocker Art Gallery opened the eyes of every one who attended to the fact that this state surely has a great exhibit of fine art which but few have been aware of before. This collection was gathered at great expense by Judge Crocker and his wife, covering a period of many years of their later life. Before the death of Mrs. Crocker she transferred the collection, together with the land and the building, to the city of Sacramento. The collection is made up of nearly a thousand works of art, many of them almost priceless.

Judge Shields' address at the art gallery on Country Life was one of the most eloquent efforts of the convention.

It is needless to say that the discussion of the 10 per cent increase in freight brought forth the most emphatic protests. A committee consisting of J. P. Dargitz, A. Brinck, B. F. Walden, and J. W. Anderson, was appointed to meet with a general committee of commercial organizations in San Francisco to protest against this threatened advance.

By Mrs. [Minna] E. Sherman

CONSUMPTION.

THE good English word consumption is a better understood name for the great white plague than the medical term of tuberculosis. Scientific men are not affirming that the bacillus of bovine consumption is the same as that producing the disease in the human family. It is believed by many of the best of the medical men that the human race sometimes has the bovine or cattle form of this disease. Many people understand the term consumption at once, and I will use it here, for there are numbers that are not apt readers that use agricultural publications for information. These people are not ignorant in the larger sense of the word but simply not used to book language. Not long ago I was asked to draw off a Holstein calf's markings for Mr. Jones. We went to the barn; Jo Jones held the calf still, Mr. Jones stood by watching, while Harry Jones also looked on with interest. After completing the outlines, I turned over the application blank and starting to fill it in, asked, "What sex?" There was a moment of doubt. Mr. Jones politely answered, "Yes it is a fine little calf." Harry did not think that answered the question and hazarded the remark, "It is black and white all right." while Jo said, "It's mother is that the white heifer." I made no reply but filled in some other parts of the blank and then said, "Is it a boy or girl?" All three replied in chorus, "It is a girl."

Colds.

While colds are bad for cows and may prepare the way for the reception of this disease, they cannot cause it. The bacilli or seed come from another infected animal and will grow when they find favorable conditions. Light, cleanliness and plenty of fresh air make immune many cows. A better way is to see that no diseased animals are introduced into the herd. This is simple, for if only tested animals are added to the herd, the disease never has a chance to become spread. I do not believe in close stabling of cows; yet it is well to shelter them from the heavy rainfalls. Now it is fashionable to plant eucalyptus trees and these can be made into shelters if the right kinds are planted. The Rudis makes good shelters when planted in rows twelve feet apart.

Family Cows.

The lungs of family cows are often diseased for years, yet with the simple life they lead the animals keep fat and eat well. When the end comes it is often in this way. The cow comes in fresh and instead of giving a full flow of milk the owner is surprised to have only a quart or two instead of a gallon or more. The cow stops eating or eats irregularly and grow thin and soon dies. Whole herds have gone in this way. I had a Swiss milker once that inherited a good dairy herd of fifty cows and a lease of land from his father. He told me, "We had never heard of consumption in cows, so when a few died each year we thought it was bad luck." One year twenty-three fresh cows died within a few months after calving and the rest of the fifty gave so little milk that the man was bankrupt and sold them for what he could get.

Remedy.

When the herd is tested it is no longer thought desirable to destroy the entire herd. The cows that are convicted of having the disease are simply put by themselves and the milk from them is boiled and fed to calves or pigs. The calves of these cows come into life free from the disease and in three years' time a new cow can be in place of every cow removed from the herd. Every cow in a herd should be tested, as it is the best form of insurance from consumption. A new herd is built up before the old one is extinct. The careful work of breeding up a herd of fine cows is retained, and though the individual cow may prove diseased, the inheritance is passed on to healthy calves.

Ranch Tests.

When a cow freshens in an untested herd and gives little milk, the rule has been to try her by giving her a little run; cutting her out of the bunch; letting the cowboy touch her up into a run with the swinging rope. When she stops running, listen for short breathing and husky cough. While it will make many fat cows pant it should not make them cough in a muffled tight way. We have spoken before of the application of the tuberculin test, as well as of the other tests under experiment as to their reliability.

It is surprising how careless people are about consumption in the human family. There is no need of having it except in as rare cases as small pox.

Resolutions.

If we could learn by heart the following as the final summing up of the knowledge of the medical world on consumption it would be well. These resolutions were passed at the International Congress on Tuberculosis, recently held in Washington D. C.:

1. That health authorities should be notified of and should register every case of tuberculosis.

2. That all means should be used to prevent contagion from man to man, which is the most important source of the disease.

3. That all means should be used to prevent contagion from bovine tuberculosis and that the possibility of the propagation of this to man be recognized.

4. That the public and all governments be urged to establish hospitals, sanatoria and camps.

5. That well-considered factory laws, child labor laws, laws regarding women's work, be insisted on.

6. That instruction in school and personal hygiene be given in all schools.

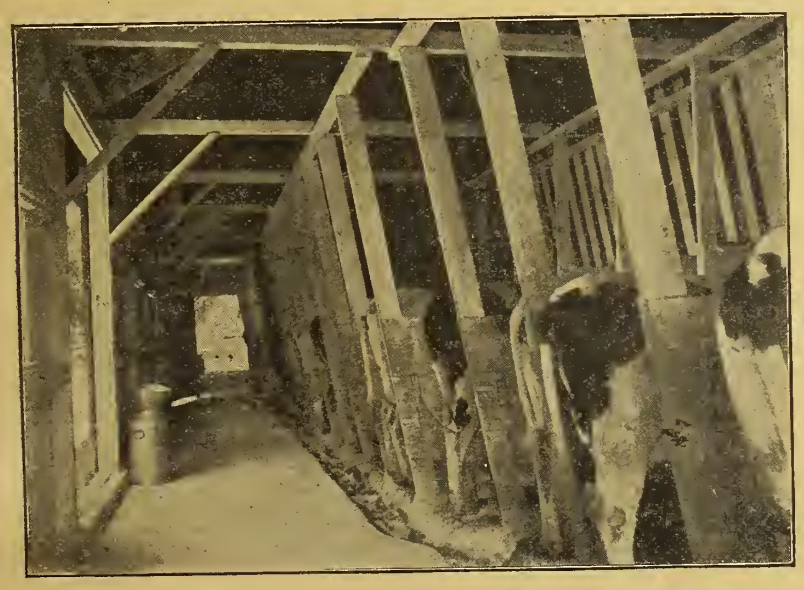
A Great String of Dairy Cows

A Public Sale of High-Class Stock Which Should Attract Attention From All Sections of the State. A Rare Opportunity to Buy Stock for Starting or Grading Up a Dairy

WHAT promises to be one of the most important events among the breeders of live stock in Southern California for years is the sale at public auction of the famous San Pedro herd of one hundred Holstein cows and four thoroughbred Holstein bulls on the Palos Verdes ..anch near San Pedro, which will occur December 22, 1908. This herd is the property of Mr. A. C. Heisterman who has spent the last fifteen years in building up the berd and who has succeeded beyond his expectations. Mr. Heisterman has been a very careful breeder and has spared neither money nor energy in breeding and assembling this herd. He has kept a careful record of all the cows, which can be had by those interested. This record is suprisingly large and is a good asset to any herd of dairy cows.



California has certainly made a record on the Holstein cow. On few, if any, other lines of stock has such a record been made. The East has taken to itself all the glory and demanded the reputation, and the prices which go with it, of being the only Simon pure producers of the purest strains of high bred stock. But with the Holstein, the best producers in the world have been bred within our borders. Easterners have come here and paid long prices for some of our stock. Bear in mind, we do not mean lucky buys made by shrewd investors in high bred stock, but purchases from strains which have, after long years of breeding, commanded a place among Holstein fanciers. This San Pedro herd is no exception to this rule of careful selection and breeding. There is some magnificent stock in this bunch which every fancier should thoroughly investigate.

Besides the registered Holsteins there will be offered a few Durhams or Shorthorn milk strain. Some of these are remarkably fine animals both as to amount of milk produced and as to size.

To please the buyer who is not able to command the higher priced stock offered at this great sale a number of grade cows, both fresh and dry, coming in soon, practically all of them of very large capacity, will be sold. The large capacity is not a mere claim for advertising purposes. Records of every cow have been kept and purchasers will be furnished with accurate information regarding them. A positive guarantee is made that every cow will prove as represented, or the coin will be returned. There will also be offered about twenty fine heifers which will be coming in during the next two months.

This sale offers an exceptionally good opportunity for some one to step into the dairy business with the best and heaviest lot of milkers in the state.

The milk route will also be sold. This route offers to a man desiring such a business, a fine opportunity, and will go, as does the stock, to the man with the coin in his hand there to talk business that day

Any one wishing a good cow or a bull to grade up their herd should take advantage of this sale and get started with some good high-bred stock. The sale is for cash and those wishing to buy will not have to bid against time bidders but can be sure of some grand bargains. We give herewith the pedigrees of two famous bulls that head the herd; the other two are eligible to a place in the register.

Prince Wayne Kornbyke, Number 51803 H-F. H. B. Fifteen months old and built on magnificent lines.

Pieterje De Kol's Promise, Number 38060 H-F H. B. Two years eleven months old. A promise of that strain which is making good.

The magnificent qualities of the Pieterje and De Kol blood are too well known to every Holstein breeder in the country to need any extolling in these columns.

This sale is to be conducted by the well known firm of live stock auctioneers of Briggs & Weber of 555 South Los Angeles Street, Los Angeles, California. Both are thorough live stock men and understand the sale business. Mr. Weber having been identified with the dairy business for over twenty years and Mr. Briggs having also conducted public sales of dairy stock for a great many years, puts them in a position to conduct sales along lines calculated to benefit the dairying interest of this section. The cash sale business is comparatively a new venture in the sale business, but live stock should be sold for cash only and we believe sales conducted on this basis will be better for all interested.

Messers. Briggs & Weber handle some of the largest sales in the country and the business-like manner in which they handle them proves that they understand their business.

Those desiring to attend this sale can take Gardena electric car at Third and Hill streets, Los Angeles, get off at the half way house station, walk south 500 feet. Or take the San Pedro electric car at Sixth and Main streets, get off at Sixth and Palos Verde streets, San Pedro, where teams will be waiting.

A free lunch will be served and a great gathering is promised to examine this magnificent herd. The sale will be held rain or shine. Should it rain, the sale will be conducted under cover.

For further particulars call at the ranch or see Briggs & Weber 555-557 South Los Angeles street, Los Angeles, California.

Let us repeat:

There are fresh cows.

There are dry cows which will be fresh within a few weeks or months.

There are young heifers coming in in two months.

Records have been kept to show each animal's performance.

Every cow is guaranteed.

Every prospective bidder is welcomed before the sale to see the cows milked.

It is spot cash or no sale, so you are not compelled to bid against people who buy on time.

There are four fine bulls which would be a credit at the head of any herd.

Milk route for sale.

Free lunch and a great big time.

CONSUMPTION.

Continued from Page 560.

7. That colleges require for entrance and for graduation studies in hygiene and sanitation.

It is said if every consumptive could be filled with love for his fellow man enough to prevent his spreading of the disease that twenty-five years would bring it under control. The greatest of all is love, just as the Bible declares it to be. Love that is kind toward others, kind to those not dependent on them, kind in the broader way of loving all mankind. A little of this love would stamp out the "great white plague."—M. E. Sherman.

CREAMERY SHORT COURSE.

On November 24th, the Creamery Short Course at the University Farm at Davis closed, and the members of the class disappeared as mysteriously as they came. The registration in the course reached 25 and was well distributed over the state. Most of the students came directly from the creamery or farm for the purpose of learning more about the handling of milk and making of butter. We are greatly pleased with this first class at the University Farm and doubt if in the future we shall have a more congenial lot of earnest, clean minded young men to instruct.

Mr. Harold Ostergard, as the result of previous experience and attendance upon the creamery course, has been placed as butter-maker with the Colusa Creamery at a good salary. He had two and one-half years' experience in the Fresno creamery and spent last summer with the Hazlewood Creamery Company at Portland.

Mr. George Kloekler, who has been assistant butter-maker at the Ceres creamery for some time, has been engaged as assistant butter-maker at the University Farm Creamery at Davis. We are receiving calls frequently for butter-makers, and as soon as it is generally known that we have men to recommend they will all be placed—who do not prefer to return to their previous employers.

On November 24th a special effort was made to place the students in touch with actual market conditions. To this end, men of prominence were secured to address the class. Mr. C. L. Mitchel, federal butter inspector of San Francisco, outlined the principles of scoring butter, allowing the class to score the various exhibits reserved from the previous regular churnings, following it up by his scores and criticisms. Having previously visited the San Francisco market the students were prepared to receive great good from this excellent demonstration.

Following this, Mr. W. H. Roussel, President of the California Creamery Operators' Association, and also President of the San Francisco Wholesale Dairy Produce Exchange, discussed the cheese trade, illustrating his remarks with references to different cheeses made by the students. He pointed out that we are not as a people using cheese to a sufficiently large extent in our diet and that the possibilities of making money through special brands of cheese in California are worth considering. There are many local types of cheese that command high prices and are worthy of study; they are usually of soft texture, mild flavor, and consumed while comparatively new.

Mr. H. R. Timm, who recently began producing certified milk at Dixon, Cal., outlined the objects and requirements of the business, stating his success so far. He is enthusiastic in his efforts to set high standards and impressed all with the importance of improving the milk supply. His output goes to San Francisco.

Besides local visitors, several creamery men from a distance were in attendance. We hope to enlarge this occasion and make it an annual occurrence.—Herbert A. Hopper, University of California.

BOOK OF ALFALFA.

The Book of Alfalfa. Its History, Cultivation and Merits, Its Use as a Forage and Fertilizer, by F. D. Coburn, Secretary of the Kansas Department of Agriculture, in its 1908 edition, is on the table of the Cultivator, fresh from the publishers. It is a book of 344 pages, 26 chapters, touching upon alfalfa from its earliest history, yields in comparison with other crops, soils and seeding, cultivation, harvesting, storing, for the dairy, for swine, for horses, for sheep, for bees, also enemies and difficulties and discouragements in growing and, in fact, every point touching upon alfalfa which the grower may wish to know.

It has an excellent frontispiece of Mr. Coburn who has been a great factor in encouraging the culture of alfalfa in the Middle West. It also has a large number of other half tone engravings which increase the value of the book.

As an indication of the scope of the book, in the chapter on pasturing and soiling for cows, it refers to the danger of bloating from pasturing on this crop, gives hints on how to avoid it, how to treat animals affected by it, also other general rules for pasturing.

In the Introductory written by former Governor Hoard of Wisconsin, he says: "I am exceedingly gratified by the preparation and publication of a new and larger work devoted to the subject of alfalfa. The earlier work by Mr. Coburn upon the same subject was in many respects a classic, and I am sure farmers everywhere will now hail with joy the advent of a kindred work by him, still more complete.

"It is strange, this late awakening all over the Union and in Canada, to the feeding value and possibilities of this marvelous plant. Again, it is wonderful to me that within a few years farmers everywhere are being compelled to revise their judgment as to their chances of success with it. A large correspondence on this subject comes to me from every state in the Union and the provinces of Canada, and success is being had in the growing of alfalfa where not more than three years ago it was deemed impossible to make it live. Of course the question of growing alfalfa contains a thousand or more chances for good or poor judgment. Men who are not too conceited, too ignorant or too stubborn to learn by reading other men's experience will go ahead rapidly and soon make a success of it.

"I believe this alfalfa movement is the most important agricultural event of the century. For the production of beef, mutton and milk, the combination of corn ensilage and rightly cured alfalfa hay, furnishes almost a perfect ration, requiring but a small addition of grain feed. Both of these can be cheaply and easily produced on nearly every farm in the land. In my herd of nearly fifty registered and grade Guernsey cows these feeds constitute the sheet anchor of my dairy work.

"No one more literally abets the growth of two blades of grass where one grew before than he who effectively urges the cultivation of alfalfa upon those who are strangers to it, and no one is more truly working for the benefit of agriculture, the basis of all prosperity, than he who proclaims its excellence as the foremost forage."

The book is published by the Orange Judd Company, New York, price $2.00, and should be on the table of every alfalfa grower in the country. This book and the Cultivator one year for $2.50.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

"By-the-Way"

Have you ever read anything about the cream separator?

Have you ever seen one?

Have you ever seen a

Tubular Separator

If you haven't seen one, you have missed a great deal and if you are skimming without a separator, you are losing more than $10.00 per cow.

With a Tubular you not only get all the cream, but a richer unwhipped, unchurned grade.

Don't take our word for it, but investigate our claims by trying a Tubular.

Catalog 260 tells how. Write for it.

Pioneer Rubber Sanded ROOFING

The Roof that "proves," sun-proof and rain-proof; needs no paint or repairs. Following are a few "Wont's" about Rubber Sanded Roofing:

Won't chip. Won't warp.
Won't tear. Won't crack.
Won't rust. Won't decay.
Won't shrink.
Won't crumble.
Won't need repairing.
Won't absorb moisture.
Won't attract electricity.
Won't need any paint to preserve it.
Won't be affected by any climatic changes or conditions.
Won't cost as much, in the long run, as other roofing.

What Rubber Sanded WILL do is told of in our booklet "ROOF TALK," which will be sent free upon request, together with samples of the Roofing itself.

100 Dairy Cows

4 Thoroughbred Holstein Bulls

At Public Sale

Tuesday, Dec. 22, 1908

Palos Verdes Ranch near San Pedro

This is the famous San Pedro herd of thoroughbred and selected grade Holstein and Durham dairy cows. Many of these cows ***are fresh;*** records of all cows are kept and buyers will be furnished with accurate information regarding them. Each cow is ***guaranteed,*** and if not as represented your money will be returned. These cows have ***very large capacity,*** and you are invited to inspect the cattle and see them milked before the sale. This will be a ***SPOT CASH SALE,*** and you will not be compelled to bid against people who buy on time. Herd consists of sixty fresh cows, thirty dry cows coming in soon, twenty heifers coming in within two months.

Registered Holstein Bull, "Prince Wayne Korndyke," 15 months old, No. 51,803 H. F. H. B.

Registered Holstein Bull, "Pietertje de Kol's Promise," 2 years 11 months. No. 38,060.

Holstein bull, eligible to register, 18 months old; Holstein bull from thoroughbred (2-year-old.) This is the finest herd of ***Holstein Dairy Cows*** ever offered to the public. They have all passed inspection and can be shipped to any part of the State; will load on cars free of charge.

Milk Route For Sale
Free Lunch

Place—Take Gardena electric car at Third and Hill, get off at half-way house station, walk south 500 feet. Or take San Pedro Pacific Electric car at Sixth and Main, get off at Sixth and Palos Verde Streets, San Pedro. ***Teams waiting.*** For further particulars inquire of Auctioneers, or

PRODUCE MARKETS.—Los Angeles Market; San Francisco Market; Citrus Markets, 574, 575.

STATE CONVENTION.

A convention which will be valuable in many of its results was the one closed last week in Sacramento. As to attendance there was nothing remarkable other than that it was rather small. In total registration, not far from two hundred, nearly all of them from outside of Sacramento, wrote their names on the big register.

But we trust the results will not be gauged by the size of the audience which greeted the speakers. And we believe it will not, for many steps were taken looking toward legislative and other action which will, we trust, lead to good results for fruit growers.

While fruit marketing had but small place on the program, it was, through the President's address and otherwise, brought to the notice of the fruit growers in a way that will make them very thoughtful as to the possibilities of marketing fruit which California's climatic and soil conditions have made possible.

The next question of interest, we believe, was that of soil conditions. There was not only continual asking of questions, but most intelligent discussion. The one calling for most spirited discussion was that on humus.

The anticipated report of the legislative committee appointed at Riverside was not made, but the committee will formulate its line of action and present it direct to the legislature at the next session.

All told, it was a lively session, and one which was full of action from start to finish.

FOREST PROTECTION.

Mr. Olmstead, who came from Washington to deliver an address before the convention, remarked that it seems a far cry from fruit growing to caring for forest trees on the high Sierras. But the relation is very close, as he showed most conclusively by referring to many sections, especially of the old world, where productive industries have been wiped out of existence by destruction of the forests on water sheds. He showed conclusively the direct as well as the indirect influence of these watersheds. This, to say nothing of other benefits coming to fruit growers from a convenient source of lumber and of fuel. Those who heard the address realized more than ever the necessity of fruit growers joining hand in hand with government rangers and state wardens in more complete protection of the forests which are such a great asset of the State.

Californians have already a more perfect appreciation of the necessity of protecting these water sheds than any other section of the United States. More disastrous fires have occurred during the past year in Eastern and Middlewestern States than all told in the history of California. However, the fires which have occurred here, especially the one of such magnitude in Humboldt county, where vast property and many lives were lost, should be a warning to Californians to be on their guard.

THE CITRUS FAIR.

The careful observer at the Tulare County Citrus Fair, which closed a few days ago at Exeter, cannot help but be impressed by the possibilities of Tulare county as a citrus producer. There was fruit of very high grade both in lemons and oranges. There was much taste exhibited by the different communities in the arrangement and displaying of their fruits. In fact, there was much more artistic skill manifested in this matter of arrangement than there was scientific skill in the selection of the fruit exhibited. In the best tray of thirty pieces of fruit might be seen fruit of the finest grade, together with that of a much lower grade. There seemed to be no ideal toward which the grower was striving. This was true botn as to size, shape, weight, fiber, grain, and texture of the fruit. Alongside of an ideal, almost perfect Washington naval would be another orange of more like an apple shape, the grower, or those selecting the fruit, seeming to hold to the idea that if it was a fine orange it would pass.

If Tulare county people before the next fair will make a schedule, or score card, or scale of requirements of the perfect orange and urge their growers to study that set of rules and select accordingly, it will lead to the forming of ideals and requirements in fruit culture which will compel more careful selection of nursery stock, possibly pedigreed. This will surely lead to a higher average standard of orchard trees and ultimately to more perfect commercial pack and to a higher reputation for Tulare county fruit. This is not said in a fault finding spirit or to hold up Tulare people to the State as producing an inferior grade of fruit. On the contrary, purely in the expectation that through this and other criticisms and through the fruit growers' own keen observation, perfection will be reached and greater prosperity come.

POLISH THEIR FRUIT.

Besides the above criticism, we may be permitted to suggest one other change which will, we believe, lead to more satisfactory results in future exhibitions. Practically all the fruit which was exhibited there had been polished with a cloth until it fairly shone. This in some citrus competitions would have absolutely disqualified the fruit from competition. The natural bloom which adds such a richness to the appearance of our fruit could have been kept on these oranges and would have added greatly to the attractiveness of the display. But the old cloth had been brought into requisition and put upon every piece a polish which almost equalled that of a mirror.

This was not only true of the citrus fruits, but a display of the most magnificent Arkansas black apples which we ever saw was treated the same as the dago fruit peddlar treats his at the fruit stand, and polished until every apple shone.

Nature is doing her part magnificently in Tulare county. The growers will meet the situation and do their part, and if we mistake not the next fair which will probably be held at either Dinuba or Visalia will show a marked advance in scientific horticulture.

FRUIT EXPOSITION.

The attention which is being attracted to the apple industry and to the production of a fruit of much higher grade by the coming National Apple Show at Spokane is an indication of the good which may be secured by other branches of the fruit industry by such expositions. At this show premiums aggregating over $35,000 are being offered, one of which is a $1000 gold coin premium for the best single apple exhibited. These facts are causing people to take notice that apple growers, especially in the Northwest, are doing things.

The Citrus Fair held last week in Tulare is primarily meant to attract attention to the section of Tulare county along the foothills known as the citrus belt. It is more in the nature of a good natured competition between neighbors and communities to make a neighborhood exhibit rather than an inspiration to the greatest endeavor to produce the very highest quality of fruit. The citrus fairs formerly held in Southern California were much the same. They were on a somewhat larger scale and attracted great attention to that section and possibly were the means of increasing planting and causing many to go into that attractive industry. But there was not that intense competition which is now prevailing in the effort to make a showing of the very highest grade fruit which may be grown on an apple tree in any part of the world. Citrus and other fruit growers of other parts of California might well consider the advisability of some such great competition which will be the means of greatest endeavor to produce fruit of only the most perfect grade.

CROP BREEDERS' ASSOCIATION.

We have before us the premium list of the second annual exhibition of the Maryland Cereal and Forage Crop Breeders' Association. This association held its meeting at Baltimore, Maryland, last week and offered cash premiums in many classes of corn, wheat, rye, barley, clover, buckwheat, timothy hay, and other forage crops.

The breeding up of the seed of corn and other products has secured for the farming industries such a material advance that it has attracted attention tbe world over. It is a satisfaction to know that this association is enlarging its scope of work and giving us an example of what should prevail in every branch of farming industry. In California this has been found especially true in the selection of seed for alfalfa, and at present in the cereal experiments at the State Farm. May this selection and breeding up be continued until many times two blades grow where one now grows.

Shop Talk

CLUBBING ORDERS.—If you failed to save the list of clubbing offers which was printed in our issue of November 19th, you should write in for it at once. Drop us a card and it will be mailed to you. It is an opportunity not to be overlooked for getting your favorite magazines and books. They may go to one or separate addresses, so it is an opportunity for neighbors and relatives to share the expense at greatly reduced rates on any combination.

CHRISTMAS PRESENTS.—Don't forget the **CULTIVATOR** as the nicest and easiest present you can give to your friends this year. The order blank is on another page, and you need only fill it out and mail to us with a dollar bill or money order. We will then start the new subscription and stop it at expiration, and also give you credit on your own account for three months as a premium for it.

To save you any trouble, too, we write the party to whom you send the subscription, giving your name and the length of the subscription. The order blank explains itself. Look it up.

Agricultural Notes of the Pacific Coast

Northern California

Ferndale, Humboldt county, gardeners are still marketing fine large strawberries.

Land owners in the Antelope district near Red Bluff are sinking irrigation wells which are proving successful.

One stock owner at Redding recently added seven high grade pure blood bulls to his stock ranch.

A large consignment of black bass was planted in the streams near Healdsburg and the Russian river.

The recent rain was quite general over the Sacramento valley and was the first rain of any importance this season.

A State Game Farm is to be established at Woodland, Yolo county, by the State Fish and Game Commission.

Butte county assessor returns make a showing of 787,347 bearing fruit trees, while of non-bearing trees there are 160,999.

Recent rains in the northern part of the state have gladdened the hearts of cattlemen and prices for cattle are now on the up grade.

The Woodland winery from its beginning on the 11th of September to the end of its run last week crushed over 2000 tons of grapes.

The dried fruit crop of Yolo county is nearly all out of the warehouses and it is thought before the first of the year it will be entirely cleaned up.

The fruit inspector at Eureka has been recently returning a large number of boxes of fruit shipped to that section which were badly infested with scale.

Central California

Water will be turned into the ditches of the Turlock Irrigation District by December 15.

Planters of deciduous fruits are already finding shortage along some lines of trees which are desired to fill out sorts.

One citrus orchard near Porterville planted two years ago supplied one full car load of oranges this season from ten acres.

Citrus packing houses of Tulare county are again busy places, sending out great quantities of fruit for the Christmas trade.

Kings County Poultry and Pet Stock Association meeting at Hanford last week was a marked success in every respect. R. J. Venn of Fresno acted as Judge.

New pumping plants are being installed in the neighborhood of Tulare and as a rule are successful in supplying a good quantity of water for irrigation purposes.

At a meeting of the Country Life Commission in Sacramento last week, members claimed that California needs ten to fifty thousand intelligent Chinamen to do farm labor.

A negro colony recently formed in Kern county is reported to have already sold 200 parcels of land ranging in size from 2½ to 40 acres. The Santa Fe railroad runs through the colony.

Up to November 25, 2660 carloads of apples had been shipped from the Pajaro valley. It is expected with continued good weather to ship 20 to 25 cars daily from Watsonville alone for the next few weeks.

Southern California

Oxnard farmers are making an effort to induce Conductor Neff to hold an institute there in the near future.

Frost caused considerable loss to tomato growers in Fullerton, Placentia, Whittier and La Habra last week.

An experimental grove of eucalyptus trees will be planted this year by the government above Vallevista, Riverside county.

Oxnard pigeon breeders are planning to ship a number of fine birds to the third annual exhibition of the California Pigeon Club at Oakland.

Imperial Valley people are talking about cotton growing, developing large orange industry, and in the meantime have a savings bank proposition in alfalfa.

The Farmers' Institute at Hemet last week was opened by Mrs. Frank Metcalf, editor of the Poultry Department of the Cultivator, who talked on the raising of young chickens.

Halliday Brothers of Coachella last year cleared $1000 on two acres of crystal wax onions and now on the same land they have a crop of sweet potatoes which will bring them $300 per acre.

Potato growers in the neighborhood of Fullerton are thoroughly aroused against the potato rot which has occurred in many of the sweet potato fields of Orange county. Fullerton has shipped something like 15,000 sacks of spuds which makes any menance to the industry such as calls for strenous action. Prof. Ramsey of the Pathological Experiment Station is investigating the trouble.

The Coast

Horse breeders of Utah county, Utah, have organized for the sake of encouraging the breeding of better horses and of making that industry one of the greatest factors in Utah's advancement.

A shipment of sweet potatoes from the Orient into Honolulu was found badly infested with a variety of ant which it was feared would prove disastrous and all were fumigated before being allowed to land.

The Hawaiian Agricultural Experiment Station is issuing a bulletin on its fruit marketing investigations. The Islands have found it necessary to organize if better results are to be secured in marketing fruits.

Twenty of the choicest boxes of prize winning apples which are to be displayed at the State Horticultural Society meeting at Portland, Oregon, next week, are to be shipped as a compliment to King Edward and to Emperor William.

Director Pearsons of Chicago in an address before the classes of Whitman College suggested that the boys build up their physical health and strength by hoeing potatoes and getting back generally closer to the soil instead of injuring their bodies by playing football.

A Cultivator representative recently reports a pleasant trip to Ashland, Oregon. He reports this a most beautiful little city in the most beautiful Rogue River Valley. Never saw such apples, and would like to go again in the berry season. He missed the orange groves, but otherwise found crops about as in California, with the people prosperous and happy.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Egg-More

is not a strong tonic and stimulant, but a highly nitrogenous, concentrated Poultry Food, very rich in protein. A little fed with good grains will keep hens healthy and make them lay lots of eggs. Have you tried it? Many have and are pleased. Here is just one:

F. W. Healy, the well-known banker and fancier of Pasadena, writes: "After hearing others praise Egg-More, I determined that if there was anything to keep hens laying through the fall and winter months, I wanted it. I bought a package of Egg-More and fed it and the improvement was very marked. Keeping on with it I soon proved the truth of your statement that 'you can't put all your eggs in one basket if you feed Egg-More.' I have raised poultry nearly all my life and for twenty years in California, but never did my hens lay so well as since I began to use Egg-More. I consider it the best egg producer on the market, and I do not intend to be without it."

You better try it. For sale by many dealers at 12½ lbs $1.00; 25 lbs., $1.90; 50 lbs., $3.60. If not by yours we will prepay freight on sack within 400 miles.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

CHICKEN CHAT.

"THE time has come, the Walrus said,
To talk of many things,
Of ships and shoes and sealing wax,
Of cabbages and kings."

And it's quite time to talk about that new incubator, if you haven't an old one that is good. I have declared myself in favor of the old hen as a hatcher of the best and longest lived breeders, but there is no use trying to deny the many good features of the incubator. The first one, of course, is the ability to use it when we, not Biddy, will to do so. The next is the increased capacity of the incubator, as few early hens can be persuaded to sit. Then, I have thought that by setting the eggs from the winter layers in incubators, winter layers would be propagated, while if we waited for Biddy only spring layers would be bred from, which would result in less and less winter layers being raised.

It's a wonder some incubator manufacturer hasn't thought of this and made capital out of it long ago, but they have thought of a plenty as it is.

Now, in selecting an incubator, remember that it doesn't take any more oil to run a 200-egg one than a 100 one, and no more time, so get one large enough to pay. If you haven't enough eggs to quite fill it, trade eggs with some good neighbor or buy enough more. Trading eggs might not prove satisfactory, as the neighbor might think you were working her like a woman I heard of once did. She borrowed butter of her neighbors by turns when butter was a big price in winter, selling her own, and repaying them when butter dropped down in the spring until her scheme was discovered. Sometimes one can put in 100 of one's own eggs and 100 for a neighbor, thus getting pay for the oil consumed and a little more.

I think two cents an egg is the rule for hatching in most places, and is surely little enough.

Sometimes one can get a bargain in a secondhand incubator, as a machine which might not do for one will hatch well for another. I owned a very fine Perfected Excelsior once, which never hatched over 50 per cent for me, owing to the jar the children made affecting the thermostat, which was very sensitive. It was a beauty so I sold it to a neighbor who had no children, and who gave it a quiet place in a furnace heated, little used sitting-room, and had a 75 per cent hatch the first time, her first experience with any machine. This was very satisfactory indeed. So you may be able to pick up a bargain like this somewhere. But whatever machine you use be sure to follow the directions that come with that particular make of machine, for the manufacturer thereof surely knows how his own machine should be run.

Set it on the level, and don't rely too much upon the cheap levels sent with it. Get a straight edged bottle, and half fill it with water, and use it for a level. Nine times out of ten it will act more satisfactorily than any spirit level you will be likely to have around.

If there is much jar on the floor where your incubator is to be set, cut old rubber boots into small squares, and put several thicknesses under each leg. Be careful about the position of the thermometer; it should rest about on the level with the top of the egg. That is, the bulb of mercury should. The top of the bulb and the top of the eggs should be about the same. If the bulb drops below the egg, the heat will be too great, while if it sets above it the heat will be insufficient.

A lady came to me in deep trouble one day. She had run a new machine through twice without so much as a sign of a chick. I asked where the eggs came from and found she had bought them of farmers who were having good hatches under hens. I asked all sorts of questions, but she seemed to have run as closely to directions as any one could do, so I thought her thermometer might be at fault, and asked her to bring it down for me to test beside mine. It was a fine one with a block of wood to keep it in corect position (a feature I was not slow in copying for my own use, later.) It tested all right, but as I went to take it from the machine, she remarked: "I didn't have it set right." "How else could it be set?" I demanded. "Why I set it up on end," she replied. So there was the trouble. The thermometer was set so that the bulb rested on the screen wire at the bottom of the egg, and they were over-heated all through, and further inquiry developed the confession that she had turned the blaze away up so as to heat them quickly. Cooked every egg at the start, you see.

I explained that the blaze must never be turned higher than to keep the 103 degree, at any time, as there is where so many chicks lose their little lives.

"But," she complained, "it takes so long for them to heat up." I told her to let it take 24 hours rather than cook them again, and her next hatch, with the thermometer rightly placed was very good, and she never had another failure.

How many would have written the manufacturer demanding the return of their money! But she was sure the fault was in her own management, and patiently persevered and came out a winner at last. And, my friends, that very patience and perseverance is what we call "luck." It is, but it should be spelled with a big P, thusly, PLUCK.

The first inquiry I made in regard to buying an incubator was to that veteran—Rankin—manufacturer of the Monarch. When his letter came, we turned it upside down and sideways, but couldn't read one word of it. We showed it, finally, to our family doctor, who was an expert at reading handwriting, and he had no trouble whatever in making it quite plain, but we didn't get a Monarch. Instead we got an old-fashioned Hammond, which was simply a big box of sawdust, with a tin heater box and an egg drawer. No thermostat, no regulator of any kind. And yet I had some 60 per cent hatches in even that primitive affair.

How many eggs I cooked I don't like to remember.

A cousin made a machine that hatched as many, by taking horse ma-

White Wyandottes The best fowl for all purposes. After years of experiment they prove it. Eggs for setting from great laying strain $1.50 and $2.00 per 13. No incubator lots furnished. Orders booked now for delivery after Dec. 1st. A few choice males for sale. ***Wm. C. Parker, 111 Pacific Ave., Santa Cruz, Cal.***

Now is the time to hatch **BANTAMS**
Golden Sebright, Buff Cochin, and Light Brahma Eggs, $2 per 15. Prize winners.
M. E. Dillingham Box 67, San Gabriel, Cal.

nure and packing it as for a hot-bed, and laying the eggs on straw covered with straw and boards, he claimed, but I never saw the "incubator" work.

We then hired a carpenter and had a hot water machine made to order, at a cost about the same as a good reliable machine, and one which gave little satisfaction, and the galvanized iron tank was soon full of holes, so that was money wasted. Since, we have bought a good many different makes, and find all of them will hatch a fair per cent of the fertile eggs, if carefully attended to.

But it is easier to hatch the chicks than to get them raised, so this will be "continued in our next," with a chapter on the care of brooder chicks. —Mrs. Frank Metcalf.

HOW TO BUILD A CHEAP BANTAM HOUSE.

First, get a dry-goods box about 3 feet square, and 3 feet high. Put a slant roof on it, and cover it with a good roofing paper which is cheaper than tar paper in the end.

The sides should be covered with the same roofing, leaving a space about one foot, six inches wide for a door on the south side of the house, and a space 8 by 10 inches for a window, which should be fastened in with strips of pine about ½-inch square, fitting as tight as possible.

The door should be made from a board free from knots or cracks, and must fit tight. Put the doorstops as close as you can, and have the door shut close.

Now build a droppings board, about 12 inches wide, the whole length of the north side, over which place a roost, and hang a muslin curtain in front to keep the birds warm on cold nights.

Next, put two or three nests under the droppings board about 6 by 8 inches and 8 inches deep.

For the scratching shed take a box three or four feet square and about two feet high. Make a slant roof, and cover the same as the other parts.

Put a door 1 foot 6 inches wide, and a window on the east side, and a window on the south side, having both windows arranged so that they will slide back, leaving only a screen of ½-inch mesh wire.

Now have a door, with a slide in it, between the two apartments.

A ventilator will be a great improvement to the house, and is very easy to make. Cut a hole about 2½ inches square in the door of the roosting room, above the window, cover it with muslin stretched, and put a slide over it, which should be closed only part way on cold nights.

You have here a house which will keep from ten to fifteen bantams comfortably.—The Standard.

GEESE.

Goose breeding is not practiced much as an exclusive industry, but can often be made a profitable side line to poultry or ordinary farming. They require but little care and food where good pasture is to be had.

The gander is usually a trifle larger than the goose, has a larger head and neck, but is not as deep-bodied as the goose. The gander has a louder call, also.

Two geese are usually allowed for one gander. The first year of their maturity, young geese lay from eighteen to twenty-four eggs. The second year there is usually an increase of a dozen over this number.

Goose eggs are often set under hens.

Chicks 10c and Up

Send today and get our price list on 19 varieties of thoroughbred chicks and eggs. Prices 10c and up. We can supply chicks in any number. Right now we are hatching several thousand per week. We ship them safely to all points on main lines in Cal., Nevada, and Ariz. Write us; we will be glad to quote prices. We are here to stay, and are the originators of the baby chick business in Southern California. Over 230,000 chicks, ducks, geese, and turkeys have been sold by us so far this year. Largest baby chick dealers in the world.

COULSON'S POULTRY FOODS
MADE IN PETALUMA
GUARANTEED
SOLD EVERYWHERE

It is a good plan to set as many hens at a time as possible, and at the end of the first week test the eggs and give each hen four eggs, which is about as many as an ordinary hen can cover satisfactorily. At hatching time care must be exercised that the hen does not injure the goslings, as their queer appearance often excites the wrath of the hen.

Various methods of feeding goslings are practiced. A good mash, not wet enough to be sloppy, is all right. Where they have all the grass or clover they want, stale bread makes an excellent food for them.

The goslings may be marketed when nine or ten weeks old, if desired, when they should weigh from 12 to 14 lbs.

A patch of rye will help out wonderfully with the winter feeding.

—Poultry Success.

TULARE COUNTY ORANGES.

Continued from Page 555.

its receipts of sufficient to meet expenses. Last year at Lindsay a nice balance was held in the treasury. When the writer left Exeter Saturday afternoon Secretary Balaam felt reasonably sure that this season would leave a nice balance to the credit of the Exeter Board of Trade. This, notwithstanding rain on a couple of days of the fair.

The Exhibits.

On the whole the exhibits were rather better than those made at the Porterville and Lindsay exhibitions; that is, results were more generally good. The principal exhibit which one saw on entering the hall was a mammoth pyramid made of preserved fruits in glass from the Tulare County Chamber of Commerce. This exhibit of all kinds of deciduous fruits, citrus fruits, olives and grapes, was solely from Tulare county products. Next to it was the Porterville exhibit which took first premium as a community exhibit and a photograph of which appears on this page. Across the aisle was Lemon Cove, with by long odds the finest exhibit of lemons made at the fair. This exhibit wore the green ribbon, indicating second prize in the locality contest. The Lindsay exhibit, which took third place with its mammoth cornucopia, made the largest showing of oranges of any one section. Dinuba won first place as exhibitor of the finest display of deciduous fruits, with a very diverse line of exhibits.

Exeter had a very tasteful pavilion but did not enter into competition with her sister cities who were her guests at the fair. Almost every other section along the Tulare county foothills made exhibits which were most attractive. That of Three Rivers was the showing of the most diverse line of products of any community there.

Growers' Winnings.

The best display of citrus fruit by any one grower in Tulare county was won by Martin & Dudley of Orange Heights. The best display of lemons, all varieties, by any one grower in Tulare county, was won by the Kaweah Company of Lemon Cove. The best thirty specimens of navels exhibited by one grower of the county was won also by the Kaweah Lemon Company. The second premium in this class was won by D. R. Griffith of Exeter. The best thirty specimens of budded oranges other than navels were exhibited by T. A. Pogue of Lemon Cove. The best thirty specimens of seedlings, won by M. E. Griffes. The best thirty specimens of lemons, one grower, W. H. Moffet, Lemon Cove; second premium in same class, Kaweah Lemon Company. Best thirty specimens grapefruit, Chio Lemon Company; T. A. Pogue, second place. Best thirty specimens of limes, Mrs. A. M. Morris, Porterville.

Some Other Exhibits.

Best display of grapes, Allan Campbell, Dinuba; second premium, Poso Grande Vineyard Company, Exeter.

Olives, best display, E. J. Norcross, Exeter; second, E. D. Woolbert; third, W. N. Armstrong, Exeter.

Apples, first place, George Dillon, Milo; one of the most striking features of the exhibit. W. A. Stewart, Exeter, won second place.

Pumping machinery.

The exhibit of pumping machinery was certainly most complete. Many of the houses of San Francisco and Los Angeles were represented directly or through their agents residing in Tulare county. Deep well pumps, centrifugal pumps, pumps of small capacity, and others more immense, were exhibited, and many of them were in actual operation; one of them threw a volume of water twenty or thirty feet high which was poured back into the tank.

Space forbids a more extended notice of this exhibit which was certainly most attractive. It is gratifying to see such an exhibit of fruits which proves the wonderful range of products in this state.

Bees and Their Care

ORGANIZED BEE KEEPERS.

A MEETING of the Imperial Valley Bee Keepers' Association, held in El Centro recently brought about definite steps toward the erection of a honey warehouse in that city for the use of the association.

The assessment of twenty cents per colony of bees was levied upon the members of the association for a building fund. Two lots on the west side of the railroad spur, extending from the main line of the Southern Pacific to the shops of the Holton Power Company, have been selected as the site for the new warehouse.

The building will be 20x40 feet, with galvanized iron walls and roof, and cement floor. It will have storage room for four carloads of honey, and will be planned so that it may be enlarged at any time the demands for more storage require the room.

The advantage of this storage for the honey producers is that the association will thus be able to maintain a stable market at a profitable price, holding the crop when prices are down and releasing it when they advance. On honey in storage the owners will be enabled to obtain a loan from the valley banks of two-thirds of the standard price.

The Imperial Valley Bee Keepers' Association received three new members at this week's meeting, and now numbers twenty-six apairy owners. This means that practically every bee keeper of the valley is in the association, and it represents fully 6000 stands of bees.

This year the general honey crop of the United States is short, and it is estimated the whole country has not more than two-thirds of a normal crop. Texas is the only state which reports a full return from the bees. In Southern California it is estimated the honey crop will not be over one-fourth of the normal amount.—El Centro Press.

INTRODUCING QUEENS.

J. P. Terry in the Deseret Farmer has the following on the introduction of queens into swarms that have lost the queen. This may be done by cutting out a two-inch square of comb to which a capped queen cell is attached from a frame in one hive. Then take a frame from the hive that has no queen; cut out enough of the comb to let the piece containing the queen cell fit in snugly; set this frame with the queen cell inserted into the center of the swarm, and in a few days you will have a new queen. If you have a queen already hatched you may introduce her into a new swarm safely by putting her in a small wire cage and inserting this cage into a frame of comb. Set this back into the center of the queenless swarm for about three days, then open the cage and let her crawl out among the bees and she is safe. It is true I have seen live queens successfully introduced by sprinkling the bees with a little sweetened water to which a little oil of peppermint had been added, then wetting the queen a little with the same scented water and letting her crawl among the bees. However, this method is not always safe, as there will often be a smell about the queen resembling that from the hive from which she has been taken and the bees of the new hive will seize upon her and sting her to death. A number of times I have tried to introduce a queen in this way and by watching the bees have seen them ball up around her and actually sting her to death. I have also seen them accept a queen thus introduced and show by their anxiety to feed her that they were particularly pleased to have her come. I have seen a queen successfully introduced by simply smearing her with a little honey and turning her loose among the swarm where she was needed. The bees would at once suck the honey from her body and wings and she was at perfect liberty to go where she pleased among them.

The most difficult place I ever found to introduce a live queen was where a worker bee had tried to take the honor of queenship. This a worker will sometimes do and will be successful in laying a few scattering eggs. The eggs thus laid, however, will never hatch a worker bee, but will always hatch drones even though they are laid in a worker cell. A worker bee who has tried to take the place of a real queen will usually fight the introduction of a real queen and will many times be successful in killing the queen sought to be introduced, especially if the latter is only a few hours old.

AMONG THE BEES.

No more ennobling pursuit exists than that of beekeeping. It is the poetry of apiculture. It is uplifting and inspiring, health-giving and useful, fascinating and profitable. It improves the mind, trains the eye and hand, cheers the heart and fills the pocketbook. No other rural pursuit is more safe, pleasant and reliable. Beekeeping, if it is not an occupation in which one can easily become wealthy, can be depended upon to furnish a comfortable living, and perhaps enable a man to lay up a few thousand dollars. Fortunately, however, the professional man's happiness bears little relation to the size of his fortune, and the man with the hum of the bees over his head finds happiness deeper and sweeter than ever come to the merchant prince with his cares and his thousands. In reply to the query: "What will best mix with beekeeping?" I have always replied, some more bees. When the conditions are favorable, I am decidedly in favor of beekeeping as a specialty of dropping all other hampering pursuits, and turning the whole capital, time and energies into beekeeping. Every beekeeper with several strains, even of the same variety, knows that some are far superior to others, that there is scrub among stock bees, just as there are scrub horses, cattle, sheep and poultry. With such scrub stock the cost of hives, combs and appliances remains the same; it is no less work to care for such stock. In proportion to its cost, no investment brings the beekeeper greater profit than superior stock.—Minnesota and Dakota Farmer.

The recent organization of a new fruit company with a basis in the Sacramento valley has given impetus to fruit planting in that section as it is felt it is an additional surety of continued prosperity.

The Anti-debris Association has decided to bring suits against dredger miners in Butte county.

TURKESTAN ALFALFA

The great drouth resister. Try it and be convinced. By repeated experiments in this State and Mexico, it has been grown with one-third less water than the common variety. Its foliage is of a finer texture and its stalks contain less wood, therefore it is all consumed.

Our seed is imported and is absolutely free from dodder or love vine.

Planting Nuts in Field.

Wishing to plant walnuts grafted to California native roots, I understand the method employed in starting the trees in nursery rows, but I am of the opinion that if the wild black nut could be planted in the field in its permanent place where its root system would never be disturbed by transplanting a better tree would result. For instance, if I plant two or three nuts in a radius around each stake and later thin down to one and next year graft right where the tree is to remain permanently, has this plan ever been carried out? If a graft should miss and the root be left standing until it was two years old and then grafted again would the tree practically be one year behind the others? At what time should the nuts be planted and how deep?—A Subscriber, Oxnard.

To which Mr. Neff replies: The objection to planting walnuts where they are to grow in orchard form is that it is very much more trouble to take care of them than in nursery rows, both as young plants and when the grafts are placed. There would be but little loss in size of tree by the failure of a scion the first year. Your plan has been frequently adopted but the results are no better than when trees are planted in nursery and the thriftiest trees selected for planting. Nuts should be planted in February and about three inches deep in well drained land.

Spineless Cactus.

Please give information as to value of spineless cactus.—A Subscriber, Banner, San Diego county.

The best information on spineless cactus may be secured by writing to the Department of Agriculture at Washington, D. C., for the bulletin on spineless cactus. This touches fully all varieties of it and treats at some length of its commercial value. In any case, we think at your altitude it would not be satisfactory. It is naturally more of a desert plant.

Lawn Seed.

Which is the best lawn seed to sow and one which will require the least water and yet be green?—F. G. S., Rumsey.

Of course blue grass makes the handsomest lawn, but where water is a factor, possibly rye grass would suit your condition better. In many sections, Bermuda grass has been used, but unless it is in your vicinity it would be unwise to introduce it as it is a serious pest. But where neglect and short water are factors, Bermuda gives a very satisfactory lawn and will stand a large amount of tramping. While not a grass, lippia repens makes a very satisfactory lawn and will withstand drouth and some trampling.

Smut.

Can you tell me what is the trouble with the apple leaves which are enclosed? What shall I do with them?—G. H. B., Petaluma.

The leaves are badly infested with smut, which is generally caused by black scale. It may be eradicated by any good contact insecticide. Rex Spray has been recommended. Kerosene emulsion will rid your trees of it, or even the kerosene spray, which is kerosene and water at the rate of 10 to 15 gallons of kerosene to 100 gallons of water, thorough mixing to be maintained during the process of spraying.

Planting Alfalfa.

I wish to plant alfalfa and have manured very heavily with cow manure. Which would be the best, to plow now and sow with barley, or to plow in the spring and sow alone with alfalfa? When should I plant cow peas?—F. L. D., Vacaville.

If your weather conditions are such that you can plow and plant your alfalfa at this season and be reasonably sure that they will form two or three true leaves besides the seed leaf before frost would catch them, it would be safe to plant at once. Planting with a nurse crop is generally considered as undesirable. If there is danger of frost wait and plant in January or February, according to the time when you expect your last frost. Cow peas are of no value planted at this season of the year. They are a hot weather crop and will succeed only when planted in the spring. They are not a pea but really a bean, though called cow peas. If you wish a winter growing crop, a vetch or blue Prussian pea, or Canadian field pea, will answer your purpose and grow all the winter through. Your other question has been referred to Mrs. Sherman.

Planting Fruit Trees.

Please inform us when best to plant fruit trees in this part of the country. Is it safe to set them this month?—Subscriber, Rivera.

It is yet rather early. We would prefer January, as the young trees in the nursery are not yet entirely dormant. As soon as they are, remove and plant so as to get the earliest spring growth of the roots.

Pruning Peaches.

In pruning peaches planted last season, about what length should the spurs be left? Trees have made a good growth and are about one and a quarter inches in diameter, and have much fruit wood.—A. B., Modesto.

Leave three or at most four branches with, say, three buds on each branch, or approximately five or six inches in length. Do not be anxious to leave longer spurs for the sake of saving fruit wood unless your main thought is for next year's crop. Bear in mind these spurs which in the future will be the main large branches of the tree will be of no value as fruit bearers except as they will support large quantities of fruit on the ends of longer branches near the extremities of the tree. If you leave them too long they will surely be weaker and give you a tree which will be more liable to break down than if you keep them back close to the trunk. Next year's spurs from these branches should again be cut approximately the same way.

Mushrooms.

Is it possible to ship mushrooms, and how long will they keep after picking? Is there a great demand for them in San Francisco?—M. K., Cave Gulch, Santa Cruz county.

At this time of the year mushrooms will keep several days if packed in small shallow boxes. The demand in the markets of our larger cities is usually very good at some seasons of the year, often as high as $1.00 per pound being charged for them at the retail stands.

Cornichon on St. George Root.

"In a recent issue you advised E. M., Newport Beach, to plant Purple Cornichon on Rupestris St. George. This combination has been extensively planted here (Contra Costa county), and without a single exception has been a complete and disastrous failure. St. George and Tokay, St. George and Muscat and St. George and most wine grapes do well here, so the fault of the St. George and Purple Cornichon is not to be laid to the fact that the St. George is not in agreeable soil."—Thos. R. Hanna, Martinez.

Cement in Plaster.

Does it benefit plaster to add cement? That is, will it make it stronger and a better wall to put a certain percentage of cement in the hair coat?—E. S. W., Oak Park.

Some plasterers who make a very

Hawaiian farmers are becoming alarmed at the rapid increase of lei which is their word for what is known amongst California farmers as dodder.

firm, hard wall, mix the plaster as usual and then add one-seventh of the bulk in cement.

Nursery Stock.

Has the rancher in this state any recourse if nursery stock after planting in orchard form proves untrue to name?—Subscriber, Glendora.

We believe that all nurserymen of the state have united in putting a similar guarantee in their catalogues, in which it is guaranteed to use all possible caution in securing trees true to name and to hold themselves in readiness to replace all stock which may prove untrue or refund the amount paid. To this is always added, "It is mutually understood and agreed between our customers and ourselves that under no circumstances shall we be liable for a greater amount than that originally paid us for stock that may prove untrue to label." Whether the grower would have cause for damages beyond this we presume could only be determined by recourse to the courts, in which, if it could be shown that the nurseryman had not used due diligence to protect his customers, or had purposely substituted, there might be possibility of still further damages.

Arsenic to Hogs.

In your issue of August 6 in the Veterinary Department, a query about a lame hog was answered as kidney worm. While I am not a veterinarian, I must disagree as to the cause as I have had three such cases in my experience and cured all of them. I bred two of them, raising three litters each of as fine pigs as I ever saw, large Yorkshires. The only effect I saw was in one litter, where one pig was affected at birth the same way. I butchered all three of the pigs, one a farrow on recovery, and had a veterinarian examine them. The only thing found was that one kidney was large and on being opened was found to have a smaller kidney fully developed inside. Now I do not say this was the cause, but it was the only thing abnormal found in the three hogs.

Now for the cure. I fed each hog teaspoonful doses of arsenic twice a day, morning and evening, until they refused to eat. In fact, I thought I had killed the first one. If this man will try this I am almost sure he will cure the hog if I am not too late. In that case it may benefit the next one in that difficulty.—F. E. Simon, Pasadena.

We spoke of this remedy to an old time farmer, asking if it were safe and he replied that he never had the nerve to try it, but his father had told him that he could not kill a hog with arsenic. Mr. Simon seems positive in his conclusions. Have other hog raisers experience on this line?—Ed.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Please address all questions that are to receive gratuitous replies through these columns to California Cultivator, 115½ N. Broadway.

All communications to Dr. Whittlesey direct should contain a great big dollar.

Bad Feet.

I have a horse that has very bad feet. I am told it is hoof rot or puss in his feet. They have a very bad odor. Will you please tell me what to do for them.?—J. E. M., Pomona.

Your description is very ambiguous If the discharge is from the hoof alone it is probably "thrush" and easy to cure.

If the discharge comes from inside the wall of the hoof, between hoof and bone, it is most likely "canker" and one of the most difficult diseases to cure.

Treatment for thrush will be a saturated solution of sulphate of copper; wet a small roll of cotton with this and pack the cracks in the hoof with it, change every day, cut out all ragged pieces of hoof.

If there is any doubt in your mind as to whether it is thrush or canker call in your best veterinarian (Dr. Lee of Pomona) as delay may hurt it beyond recovery.

RELIABLE REMEDIES.

Under this heading will be mentioned some of the Veterinary Remedies used by Dr. Whittlesey and which the readers of the Cultivator will be most likely to find useful. They are not ordinary proprietary mixtures put up to sell but are from old well tried formulas, whose effects have been tried in an extensive practice in Southern California of nearly a quarter of a century.

Dr. Whittlesey's Sulpho-Arsenical Salve for the cure of deep fistulous ulcers in any part of the body. "Pole evil," "Fistulas," "Quitters," "Thrush," "Scratches or Grease Heal," "Warts," "Collar-sores," "Sit-fasts," in fact any chronic, indolent sore that refuses to get well under other treatment. $1.00 per package post paid with full printed directions for its use in different sores.

Dr. Whittlesey's Antiseptic Healing Powder for forming a coating or scab over large raw surfaces, to exclude the air, keep away flies, and destroy floating germs which may lodge on the sore, makes a very cheap and convenient dressing for wire cuts, fresh collar sores, and any of the many sores occurring to stock on the ranch. $1.00 pound can post paid. Enclose your dollar in an envelope and we will take all chances of its being stolen.

Imperial Valley Lands have a greater earning capacity per acre than any land on earth. For price list and information address, James S. White Jr., and R. A. Holt, Holtville, Cal.

Household Department

IF I HAD KNOWN.

If I had known in the morning
How wearily all the day
The words unkind
Would trouble my mind
I said when you went away,
I had been more careful, darling,
Nor given you needless pain,
But we vex "our own"
With look and tone
We might never take back again.

For though in the quiet evening
You may give me the kiss of peace,
Yet it might be
That never for me
The pain of the heart would cease.
How many go forth in the morning
That never come home at night,
And hearts have broken
For harsh words spoken
That sorrow can ne'er set right.

We have careful thoughts for the stranger
And smiles for the coming guest;
But oft for our own
The bitter tone.
Though we love "our own" the best;
Ah! lips with the curve impatient,
Ah! brow with that look of scorn
'Twere a cruel fate
Were the night too late
To undo the work of the morn.

—Margaret E. Sangster.

SARGENT'S SACRIFICE.

HERBERT Sargent's eyes wandered from his admiring friends to Julia Guilford, his opponent. He took in every detail, the mass of jet black hair and the cheeks, dyed a deep crimson flush that rose even to the eyes, which gleamed with wonderful brilliancy as she nervously clasped and unclasped her slender fingers.

It was not like Julia to go to pieces as she had done in class today. He felt mean at taking advantage of her weakness to forge ahead, still it was fair and Julia always played fair.

He longed to go up and speak to her but lately she had ignored his existence and he would not force himself upon her. It had not been always this way. Some of his sweetest memories were of winter afternoons and moonlight evenings, of long stretches of gleaming ice and Julia beside him, trig and trim from white cap and sweater to gleaming skates. Or again, summer afternoons boating on the river and roaming through the woods.

He wondered what had caused the change. Surely not the contest for the scholarship, the winning of it could not mean to her what it meant to him. To her it would be simply an honor, to him a means of earning his daily bread.

He lingered about, and as he entered the dressing room his attention was arrested by the sound of a smothered sob and low voices. He felt guilty but he could not help listening as he heard Julia's voice.

"Alice, I must win. Aunt Amy has it all planned to take me into the city into society this fall and marry me off to some one in a high position. And she'll do it, too, unless I win the scholarship and force her to let me go to college."

He understood it all now, and whistled thoughtfully to himself as a vision of square-jawed Aunt Amy rose in his mind.

From that moment he tried to let her get ahead, but the more indifferent he grew the greater seemed his chances of winning. He pitied Julia, growing thinner and more nervous every day. At last everything was over but the announcement of the percentage in mathematics. They stood even already in every study, and he knew he would pass ahead of her in this. He knew by the pathetic droop of her head that she realized it too.

"Sargent, your paper has been unaccountably lost. We have made unavailing search for it, and so give you your choice—we will pass you on 75 per cent or allow you to take another examination."

Herbert thought a moment. His glance took in a white face and nervous, twitching fingers.

"I'll take the 75 per cent, sir," he said.

A few days later he saw a slender girl come forward to receive the scholarship, a girl whose face was as white as the dress she wore. He strained forward and his eyes met hers, and suddenly her cheeks were dyed with a crimson flush.

It was fifteen years later. In the office of the big machine company of which he was senior partner, Herbert Sargent sat, dreaming. He was living again that graduation day and he saw again in his dreaming the white face which so suddenly dyed crimson.

The paper before him brought back the dull ache which he had tried for years to stifle.

"Graduation at Benton.

"Miss Julia Guilford, the noted writer, addresses graduates at Benton Academy. A former graduate of noted school, etc."

A light step aroused him and he turned about to face the object of his thoughts. There stood Julia Guilford, whom he had last seen fifteen years before, and on every line of her self-reliant figure and beautiful face was written success.

"Miss Guilford—Julia," he stammered in astonishment, and placed a chair which she refused.

"No thank you I have something to tell you, which I can say better standing. Yesterday," she said in a low voice, and she tried to meet his eyes, "yesterday I spoke at Benton."

"It brought back many memories—may I never live through another such day. However, it gave me courage to say what I have tried to say for a long time." She hesitated, then raised her eyes and met his. "I stole your paper on mathematics and cheated you of the scholarship."

And as she stood quietly she stammered on: "I intended to make it right. I intended to have uncle put you through, but they turned on me and he was guardian of my money. I had not the courage to confess. Then when I had gained control of my property you had won success in the business world and my chance for restitution was past."

He still stood quietly, his hand playing with his watch charm, which he unfastened and held in his hand. She continued:

"I have watched you advance step by step, and the remembrance of what I did has never left me. Yesterday was more than I could bear, and I have come to tell you that whatever success I have won belongs to you."

"Julia," he said, "I knew fifteen years ago."

She stared in amazement.

"I found the paper in the hollow oak," he said, and she gasped as he held out the watch charm, a heart-shaped bangle, "and found this with it."

"Why—" she stammered.

This quick-firing "three-shot" gun is the handiest and most up-to-date article ever made in the shot-gun line. It's yours for $8.00

Sent by express, prepaid, to any address in the United States, upon receipt of price. Absolute satisfaction and safe delivery guaranteed.

The HOPKINS & ALLEN "Three-Shot" Gun

is unequalled for quick shooting. The three shots, one in the gun and two in the clip, can be fired with the rapidity of a repeater. No more missing good shots because your ammunition isn't with your gun. There are always two shells in the clip. No need of keeping a loaded gun in the house—a shell is slipped into the breech at a second's notice. Your gun is always ready for a shot at hawk or game, and you don't have to hunt for shells while the game gets away.

You were never offered a gun as good as this for the price.

Fine decarbonized steel barrels bored full choke for close shooting and deep penetration. Frame case-hardened. Stock and fore-end fine walnut. Top snap action, locks automatically, and joint takes up its own wear. Rebounding hammer, rests in safety notch after firing, eliminating danger of accidental discharge. Hard rubber butt plate. This gun is guaranteed to shoot factory-loaded nitro powder shells. 30 or 32 inch barrels. Automatic ejectors.

1908 GUN GUIDE, FREE!

"Because, Julia, I loved you and wanted to help you. I knew and waited—know that some time the old-time Julia would come back."

His mouth was tremulous.

"I was a long time, and I paid a big price for honor—for, Herbert, all the time I loved you, too."—Spokesman Review.

COUNTRY AND CITY LIFE.

Country life has its drawbacks, but it has its great advantages which overcome them. True, those who live in the country are "Rubes and "Farmers" and "Hayseeds" to the cigarette smoker in town, but the boast of the business men in the world today is that they we born on a farm. Take away the surrounding evils that beset the young men or women on the threshold of life's journey in the city, and substitute the helpful influence of nature, and you fortify them for the sterner walks in life. The few things which they do not know about table etiquette and when it is proper to leave two visiting cards and when but one, they will catch onto much quicker than city boys or girls will learn to properly stoke the furnace or make good bread. No boy or girl need be ashamed of living on the farm, for if they have taken advantage of what it has offered they are well fortified for after life.

There are 125 ways of cooking eggs. All the brides we know have but one way—frying. After they have kept house a number of years they learn how to soft boil them. We once heard of a woman who knew how to cook eggs four ways, but we regarded it as a fairy tale.

Every girl should be educated how to pick out a good steak, how to tell when a chicken is tender, how to tell when fish is fresh and when celery is of the right quality. The bargain counters in the groceries and meat markets are more worthy of attention than those of dry goods stores.

AT THE COMMENCEMENT.

The president of the board of education had risen to present the diplomas. He had never officiated in this capacity, and was a little shaken.

"Class of 1908," he said, "you have gained the threshold of life. You have—you have—you—you—"

The crowd tittered, and the members of the class trembled for the speaker and the success of the exercises.

"As I said," the speaker resumed, gathering his wits for a fresh start, "you have now a threshold on life."

Laughter rose in the house, and the other board members held their hands over their mouths, showing very red faces.

"No!" cried the speaker, by this time fairly in the throes of stage fright, "I meant to say that you are now in the hole for life!"

The crowd shrieked with amusement, and one of the board members fell from his chair, howling with glee.

The president's eyes rolled in a fine frenzy, and he ran his fingers through his hair.

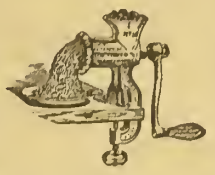
"No—no!" he exclaimed, "I don't mean that!"

He made one last and futile effort to regain his composure, and advanced a step nearer the class.

"Class of 1908," he said in a voice husky with emotion and suppressed excitement, "you have now a tail-hold on life."

The richest jewel in th' world is unselfishness.

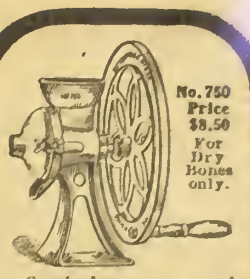
Large Family Size. No. 10—Price $2.50.



It is really better to own an "Enterprise" Meat Chopper and cut your sausage meat easily, quickly and well, than to trust to a borrowed machine to "grind" it. The

No. 25. 4 Quart Japanned. Price $5.50. 4 sizes. Tinned and Japanned.

Half the work at butchering time is spent in lard and sausage making. You can increase your products and lessen the time and labor of Sausage Stuffing and Lard Pressing if you use an



No. 750 Price $8.50 For Dry Bones only.

Cracked corn, ground bone, oyster and other shells, etc., are important items of egg-making material and *must* be furnished in winter to secure an abundance of high-priced eggs. They *can* be furnished at lowest cost by the use of an

ENTERPRISE

Meat and Food Chopper

is made in standard family sizes, and not only saves half the work at butchering time, but is useful in the kitchen every day in the year. "Enterprise" Meat Choppers *cut* the meat with a revolving steel knife against a perforated steel cutting plate without crushing, and make tough meat tender. Easily cleaned, practically unbreakable, and will last for years.

Made in 45 sizes and styles; for Hand, Steam and Electric power. No. 5, Small Family size, $1.75; No. 10, Large Family Size, $2.50. Sold direct if not to be had from your dealer.

Sausage Stuffer and Lard Press

Stuffs sausage quickly and uniformly. Patented Corrugated Spout prevents air entering the casing, thus assuring the preservation of the sausage. Cylinder is bored absolutely true. Meat cannot rise above the plate.

Can be changed into a Lard Press in a jiffy. Machine is strongly made and will last for years.

Other famous "Enterprise" household specialties are Coffee Mills; Raisin Seeders; Fruit, Wine and Jelly Presses; Cherry Stoners; Cold Handle Sad Irons, etc., etc.

Look for the name "Enterprise" on the machine you buy.

Bone, Shell and Corn Mill

Order one early in the season, and the hens will surely pay for it. The mill shown in cut costs only $8.50. Will grind corn, *dry* bones, oyster and other shells, etc., making valuable poultry food. May be used for making bone meal fertilizer.

A good all-round mill for farmers and poultrymen, and for strength and durability is unexcelled. Weight, 60 lbs. Capacity, 1¼ bushels of corn per hour. Look for the name *"Enterprise"* on the machine you buy. Sold by Hardware and General Stores, etc.

FREE—The "Enterprising Housekeeper"—a book containing over 200 choice recipes and kitchen helps. Sent on request.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Sonoma County Co-operative Poultry Association has let a contract for their eggs for the coming three years with the Sonoma County Fruit and Produce Company in which it is agreed that the 19 cent minimum for first grade and 17 cent for second grade shall prevail. It is regarded by the poultrymen as a good contract.

W. E. Smith, one of the largest apple growers in Colusa county, says the best way to keep apples is to pile them on top of a few leaves on the ground and cover lightly with leaves or branches. This method has succeeded perfectly with him.

Grape growers about Lodi are discussing an organization for self protection this winter.

San Francisco Markets

SAN FRANCISCO, Dec. 8, 1908.

Butter.

Butter has declined three cents for extra during the week. Most other grades have remained stationary.

The official quotations of the San Francisco Wholesale Dairy Produce Exchange for yesterday are as follows:

SHORT HORN SALE.

An unrivalled opportunity will be afforded the breeders of pure-bred Short-Horns on January 5th, 1909, when a public sale will take place at Chase's Pavilion, 478 Valencia Street, San Francisco, California, of some especially choice specimens of this well known breed of cattle.

The animals entered in the sale are the increase of the respective herds of Mrs. J. H. Glide, of Sacramento, Cal., and the Howard Cattle Company, San Francisco, Cal., two of the best known breeders, owning two of the largest herds in the state.

The cattle entered are all thoroughly acclimated, a great consideration, and are in good, sound, thrifty condition. The bulls are, for the most part, the get of such famous sires as Imported King Edward 172814, grand champion at the Lewis & Clark Exposition in 1905, and Imported Straight Archer 209093, sire of International winners, while many of the cows and heifers are bred to one or the other of these bulls, than whose breeding there is none better, while their individuality is hard to excel.

The Hoopa Valley Indian Reservation in Humboldt county is to be surveyed by order of the government and many believe the valley, which contains some of the choicest land in the county, is to be opened for settlement.

The Sacramento Valley Sugar Company at Hamilton will have its own boats in operation on the Sacramento River for hauling beets to the factory from river points next year.

A ten-horse team attached to two great wagonloads of pumpkins attracted attention at Hanford last week as they were being driven to the Boyle ranch near the city.

Rural Telephones

Do you realize that rural telephones, more than anything else, tend to increase the earning power of every farm and farmer? Do you realize that

ALL of the material needed to build the very best rural telephone line—exactly the same as the Bell Company puts up—will cost you and your neighbors less than 20 bushels of wheat each?

Over 4,000,000 Western Electric Telephones

are in use in the United States to-day. We made the first telephones and we have made the most—in fact, we have made more than all other manufacturers combined.

We have brought the rural telephone within the reach of every farmer, and with our Free Bulletins before him a boy can install and operate the system. Our telephones are guaranteed.

Cut out this advertisement, write your name and address on the margin and mail it *to-day* so that the Free Bulletins, which describe the entire plan in detail, may be sent you immediately.

Some Future Timber Producers

EUCALYPTS in flats. A portion of over a half a million of growing trees in the nursery of the Leonard Coates Nursery Company at Morganhill. These trees were grown without shade or protection. These flats contain one hundred plants each.

THREE favorites, Rudis in center of above photograph one of our most beautiful Eucalypts. At the right Corynocalyx, while the one at the left is the old time favorite Globulus or blue gum. All show two and a half years growth.

EIGHTEEN month's growth of Polyanthema or Australian Beach is shown in the center tree above. The bluish white leaves of this tree make it a most beautiful one. It is a drouth resistant tree and rather slow of growth.

VIMINALIS, manna gum, eighteen months old, twenty-five feet high, three and seven-eights inches in diameter, six inches from the ground and grown without a particle of irrigation. Will stand the cooler weather but not as valuable as the red gum.

TURKESTAN ALFALFA

The great drouth resister. Try it and be convinced. By repeated experiments in this State and Mexico, it has been grown with one-third less water than the common variety. Its foliage is of a finer texture and its stalks contain less wood, therefore it is all consumed.

Our seed is imported and is absolutely free from dodder or love vine.

Write for prices. Special quotations for large quantities.

Opportunity for Wealth in Eucalyptus

A Wonderful Tree Brought to California, Planting of Which Should be Done Intelligently and With Knowledge of the Limitations of the Business

THE interest which has been created during the last few years, and which in the past several months has become almost a eucalyptus planting boom, is attracting more attention to this wonderful tree than at any previous time. Al over the state reports of activity in planting, or at least, preparations for planting, are being made. Some of this planting will probably cause the financial loss of those making the planting, because of not understanding all conditions and because of too great expectations which are liable to come from enthusiastic representations from promoters of some companies that have been formed. This is not said with any expectation of dampening the ardor of those who are engaged in this excellent work of planting trees. Fortunately, if errors are made in this case they will generally be made in the right direction. "When in doubt, plant a tree," is good advice. That is, much good will come from the planting of these trees, even if these large claims are not all met.

The crying need of the country now is, and will be more and more so, more trees, but every one who observed fruit planting in this State during the past quarter of the century knows that in orange culture and practically every other line of fruit industry, trees have been planted in unsuitable location necessitating removal and great loss later. In this respect great care should be observed in studying into the requirements of climate, soil, moisture, etc., of the various varieties.

To that end the Cultivator this week gives considerable attention to eucalyptus culture. The point we have in mind is shown in one of the varieties, that of the marginata or the famous Jarrah, which is such a wonderful and profitable tree in its native country, Australia. For some reason, probably due to our arid climate, this tree has never been grown in this State so as to reach any material size. Its planting on the part of some is still urged and the experimerter who wishes to test it out will probably do well to continue to plant it in small quantities but the planter who is engaging in the business on a purely commercial basis should use only the thoroughly tested varieties.

Out of the several hundred known eucalypti there have been tested in this State nearly 100 varieties at the Forestry Station at Santa Monica which was established by the State University, and still maintained by it, several years ago. There are now 70 of these varieties, all above ten years of age and all bearing seed. From the manner of growth of these trees at Santa Monica much valuable information may be had. The best way to secure this information is by personal investigation and conversation with the superintendent, Mr. Ingham.

But in case of inability to secure the information in that way, the bulletin issued by the Experiment Station at Berkeley, written by Mr. Ingham, Bulletin 196, has a valuable fund of information. Another book which is of great value. but which we fear is now out of print and may not be secured, is "Eucalypts Cultivated in the United States," and published as Bulletin Number 35 by the United States Department of Agriculture. This was written by the late A. J. McClatchie. One valuable feature of this book is the liberal use of engravings, showing leaf, blossom and seed in such a way as to assist in identification of the varieties.

Eucalypts Which Revel in Desert Heat

Theodore Payne of Los Angeles Writes of Experience in Planting Trees in the Colorado Desert

While all the species of Eucalyptus thus far tested in California, with possibly one or two exceptions, succeed near the coast; there are comparatively few species which can be grown successfully under the climatic conditions which exist on the desert.

An Experience.

Some few years ago the writer experimented with twenty-five species at Thermal, on the Colorado Desert, and out of the number five proved successful. These were as follows: Eucalyptus leucoxylon (Victorian Ironbark,) Eucalyptus polyanthema (Red Box,) Eucalyptus rostrata (Red Gum,) Eucalyptus rudis, Eucalyptus viminalis (Manna Gum.) Of these five the Eucalyptus viminalis grew much faster and straighter than any of the others, many of them being from 12 to 15 feet high in less than one year from the time they were planted. This tree, however, is not so desirable as some of the other species if a salable timber is the object. but as an ornamental tree on the deserts both in California and Arizona it has arrived so well that it has often been termed the "Desert Gum." There is little known about the timber of this species, however, and it is not generally considered of very much value. Of late a disease has attacked some of these trees, and according to reports some of them are dying off, so for these reasons it is not likely this tree will be planted extensively.

Fine for Lumber.

Probably the best species for timber purposes on the desert is the Eucalyptus rostrata (Red Gum.) This has proved very successful in the Imperial Valley, and appears to gain faster than here on the coast. It is extremely hardy, enduring both heat and cold, standing a minimum temperature of 15 to 20 degrees Fahrenheit and a maximum temperature of 110 to 120 degrees. It

Save Time—With the Brewster Picking Sack—Save Fruit

A new method sack—invented and perfected by lifelong growers. Eminent orchardists pronounce it perfect. Those who have tried it say they would not be without it. Actual tests show that a man can pick twenty-five per cent more fruit with it and with greater ease.

Sack forms semi-circle about picker's body—is supported by straps over both shoulders and held tight by belt around body. The picker can thus work with ease either on ground or ladder. When full, it does not extend below the hips.

A great feature of the Brewster Sack is the patent gate (see illustration) WHICH PRACTICALLY ELIMINATES BRUISING. Simply unfasten a hook—the gate drops—and the fruit can be quickly but very gently poured out.

The sack holds as much fruit as the old style sack.

Made in two grades.

Regular picking sack grade, sent express prepaid for $1.50.

Special extra quality—that will outlast two ordinary picking sacks—express prepaid $1.75.

Sierra Madre Sack Co., Sierra Madre, Cal.

We want reliable men in every locality to demonstrate this sack and act as our agents.

With the Citrus Growers

THE GUAVA.

FROM an address by C. P. Taft of Orange, at the Whittier Institute some months ago we note the following on the Guava:

The strawberry guava is too well known to more than mention in this article, but the type commonly called the lemon guava, because it is sometimes, though not often, very acid, is not so generally grown, and where known is not particularly well liked. It has great possibilities, however. In size it is far larger than the so-called strawberry, and of quite attractive appearance. Sometimes the color is almost white, sometimes quite green, and frequently of a bright yellow, often with a red cheek. These variations are only what is naturally to be expected from seedlings, and almost no others have yet been planted. I have fruited quite a number, perhaps a hundred, and find it to possess qualities which if properly selected and developed will cause it to equal the strawberry guava in hardiness and flavor and early ripening.

The Feijoa.

Along with the guava should be mentioned that recent valuable introduction from South America, the Feijoa Sellowiana, a member also of the myrtle family. In habits of growth it is much the same, and while the foliage is not so handsome, being of a generally silvery gray effect, the flower is very showy. In May it sends forth a great profusion of blossoms, which may be called red, white and blue, unless one desires to be perfectly accurate, in which case the blue would have to be changed to purple. The petals are unusually thick and fleshy and very sweet to the taste. The highly perfumed fruit, about one and one-half to two inches or more in length, comes in November. The flavor is delicious, like the strawberry, but lacking the acid. The seeds are very small, almost unnoticeable; quite a contrast in this respect to the guava.

IMPROVEMENT OF CITRUS FRUITS.

In the last few years the methods of handling and shipping citrus fruits have been so changed that fruit handled under the best known methods is practically sure to arrive in the eastern markets in as good condition as when it left the packing house. This fact, among others, ought to be an incentive to produce a better grade of fruit; that is, to raise the percentage of fancy as compared with other grades. In the orange there does not seem to be any pressing need of new varieties, for the Washington Navel and Valencia, when grown to perfection, are par excellence. But there is room for improvement in the strain, especially so of the Washington Navel. Go into almost any packing house and it is evident that the amount of strictly first class fruit is small as compared with other grades. More effort should be put forth to improve the average. One of the ways which seem feasible today is by bud selection. The Washington Navel shows great tendency to sport, as can be seen in almost any grove. Some of these sports may not be worth propagating, while others show points that are worthy of trial, as has been shown by the new varieties or strains, such as the Golden Buckeye, Golden Nugget and others.

The Citrus Experiment Station, at Riverside, is making a selection of citrus trees found in the different localities that show variations which seem to warrant propagation, and would like to get in touch with the growers who may have a special tree or any tree which shows characters that differ from the ordinary. The Citrus Experiment Club, composed of orange growers of Riverside, has plans on foot to work in co-operation with the Station along the line of bud selection. The Station would be very glad indeed to hear from other clubs or individuals in regard to any special or freak trees that they may have. A letter or postal addressed to the Citrus Experiment Station, Riverside, in regard to this matter will receive prompt attention.—Prof. Ralph E. Smith.

THE OTHER SIDE.

The campaign against green oranges in Florida has brought so many arguments against it that finally a friend of the green fruit has arisen and writes as follows in the Packer:

During the last few years many papers in the state have printed editorials and communicated articles which have been extremely mischievous and have helped to bias unfavorably public opinion on the subject. and to create unwarranted prejudice, particularly in the North, where influential papers have given some of them space. It seems as though the time is ripe to present something on the other side of the question.

Because of such newspaper articles, and because of persistent efforts of certain parties who wish to prevent the shipment of green oranges the public, generally, are fast gaining the impression that there is something fearfully dangerous to health about the immature fruit, but this is a fallacy. When a fully grown green-skinned orange is eaten properly there is no more appetizing, healthy, system-cleansing fruit offered for sale in any market and there never was, or can be, the slightest actual proof produced to the contrary.

When an orange, or any other fruit is reaching a normal or full size and growth begins to cease, nature goes to work at once to transform the raw starch of the fluid contents (the only element not digestible by man) into dextrin and to sugar, and as soon as that process begins all danger from the use of such fruit is at an end, and the same is edible. The only advantage the overripe fruit has over it is that the juice has become extra "sugary," more of the dextrin being converted into sugar, hence slightly more easy of digestion, and, to some more palatable.

On the other hand, an orange, or any other fruit, held for shipment until ripe is a menace to health, because the overripe juice it contains rapidly degenerates, particularly when packed or exposed to the sun's rays, producing ferments antagonistic to the digestive fluids of the human organs. A green orange has a tough non-elastic skin, protecting the interior from injury in shipment.

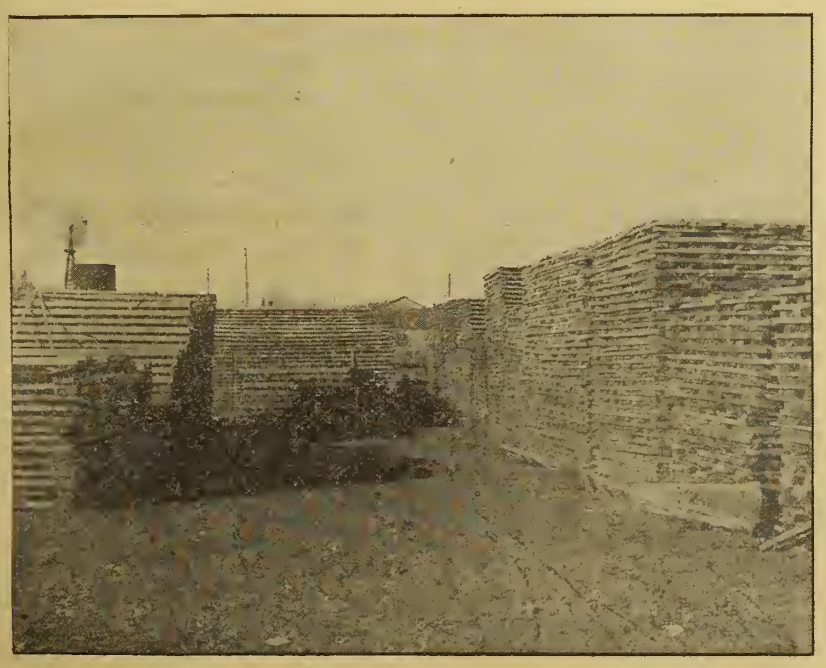
Tustin, Orange county, reports large shipments of all kinds of vegetables, there being shipped from that district alone over 10 large crates of peppers and 10 sacks of green peas each day.

A Valuable Gift from Australia

An Interesting Article Written for the Cultivator by Leonard Coates of Morganhill, with Photos by the Author

A BOTANIST by the name of L' Hertier first discovered and named the Eucalyptus. The botanist has to go to the dead languages to name a plant, for all nations agree to this, whereas the French, German, Italian or English language would be acknowledged only by those people using any one of them. Not only that, but the discoverer of any plant, insect, or animal, has the accepted right to give it a name, creating such a name himself, generally, by the aid of a knowledge of Greek or Latin. Thus, M. L' Hertier called this family of trees which he found growing in Australia Eucalyptus, from the Greek words eu, well, and kalypto, concealed because he noticed a peculiarity in all these trees in the flower bud being hermetically sealed, the lid subsequently falling off. Closer examination showed that, by the arrangement of the flowers, the seed, and other botanical characteristics, these trees could be classed with what is known as the Myrtle Order.

Eucalyptus logs at the Mill.



Seasoning Eucalyptus Lumber.

Still further investigation revealed the fact that this Eucalyptus family comprised a great many individuals, to which it was necessary to give names in order to avoid confusion. There are dozens of very different trees, both in appearance and in quality of timber, as well as in habit, that would have equal right to be called "red," because of color of the wood, or of the young shoots; or "blue" from the blue look of the leaves; "gray," from an appearance indicating that color; or "white," because of the smooth, white bark. Bastard," "swamp," "stringy-bark," "yellow," "weeping;" all these names, and many more, would be, and are, really meaningless, and could lead to nothing but confusion. Hence, while the family is known all over the world as "Eucalyptus," the individuals of that family are also universally recognized as "Eucalyptus globulus," the last name in allusion to the globular shape of the young leaves; "E. Citriodora," from the lemon-scented odor of the leaves, and so on. It would be useless to order of the seedman or nurseryman "gum trees," or eucalyptus trees except under their only accepted correct names, for otherwise he could not know what kind was wanted.

"Without the eucalyptus California would be a very different state, and

EUCALYPTS WHICH REVEL IN HEAT.

Continued from Page 579.

seems to revel in the heat, and is a fast grower, providing it is supplied with plenty of water. The wood is heavy, hard and extremely durable both under ground and in water, and is used in Australia for railway ties, telegraph poles, shipbuilding, bridge-building, street-paving, fence posts, etc. It also takes a fine polish, and is used for interior finishing.

The Eucalyptus leucoxylon (Victorian Ironbark) thrives under the same conditions as the Red Gum, standing the same extremes of heat and cold. It grows rapidly under desert conditions, but is rather inclined to grow crooked when young; for this reason careful staking is essential. In its native country it attains a height of 100 feet and supplies a timber of great strength and durability, according to Australian tests bearing nearly twice the strain of American oak and ash and excelling hickory by about 18 per cent. The wood is much used for wagon wheels, poles, etc.

The Red Box.

One of the most beautiful of all the eucalypts, and one which thrives on the desert, is the Red Box (E. polyanthema.) It will stand the same extremes of heat and cold as the Red Gum, but is not a fast grower. In Australia it attains a height of 150 feet and furnishes a very hard and lasting timber used for mining purposes, railway ties and wagon building, and for fuel it is unsurpassed by any other species. As an ornamental tree it is one of the most desirable, of rather spreading habit with roundish silver-gray foliage and producing clusters of many small white flowers at the ends of the branches which are rich in honey and much sought after by bees.

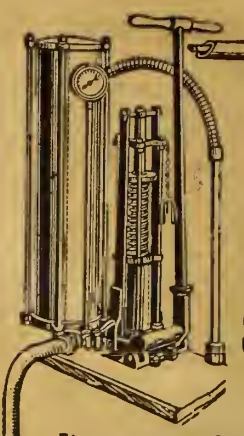
Tereticornis.

The Forest Red Gum (E. tereticornis) has been planted extensively near Holtville. It is closely allied to E. rostrata and under conditions near the coast is considered preferable to that species on account of its growing straighter and faster; but according to the experience of some of the largest planters on the desert it has not proved so good as E. rostrata, and while they made a good start, many of them died off without any apparent cause before they had attained one year's growth. It may be mentioned here that there are two varieties of this species, one producing a very small seed vessel and having a round leaf and somewhat square stem when in the young state, the other having a larger seed vessel and a lance-shaped leaf, more resembling the E. rostrata. By many the former variety is considered the best. Among others the late Mr. Dwight Whiting, who planted large groves of eucalyptus at El Toro, in Orange county, was particularly favorable to this tree, and planted it very extensively; while it may be the best for coast conditions, it is this form that has not proved successful on the desert. The other type, which more closely resembles E. rostrata, might prove a better one for the desert conditions. In Australia the tree attains a height of 160 feet. The timber is used for railway ties, telegraph poles, etc.

Sugar Gum Will Stand Heat.

Eucalyptus corynocalyx, or the Sugar Gum, as it is commonly called, will also stand the intense heat of the

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.



See That Patent spring?

It means much to the fruit grower who realizes the need for effective spraying, but deplores the ordinary pump with its exhausting labor, its unsatisfactory spray and its continual clogging and bother. This spring is found only in

Bean Magic Spray Pumps

It would be found in others, but the Bean Patents prevent it. This spring divides the work, permitting the operator to do half the work at each stroke of the handle. And he works against but half the pressure indicated on the gauge. It saves just one-third the labor. Two sizes of Bean Magic pumps; both have Bean patent spring, non-clogging ball valves, and other exclusive features.

Our illustrated catalog No. 21 describes ten sizes of hand pumps, and contains much valuable spray information, and formulas. Catalog No. 22 describes Power Sprayers. Both books sent free. Write for our special offer; state number of acres and kind of fruit.

EUCALYPTUS

Balled in moss and leaf mold. All the roots saved. None sent out too small to plant. Sample lot of 100 in flats, tops protected, $1.60.

Henry Shaw
320 River St. Santa Cruz, Cal.

The official estimate for the output of oranges in the Tulare county country is claimed to be very close to the twenty-five hundred mark.

desert, but will not stand much cold. The writer had this among the twenty-five species experimented with, and it grew admirably through the summer, but was frozen down to the ground the first winter. However, the season mentioned was an exceptionally cold one, and the tree has since been tried in the same locality, and withstood the cold. This tree is probably the most drought-resisting of all eucalypts, and is one of the best for planting on dry hillsides; however, it is not a fast grower unless supplied with plenty of moisture. In Australia it attains a height of 120 feet, and furnishes a very hard and durable timber, used for railway ties, fence posts, etc. Posts set in the ground, after fifteen years, showed no sign of decay.

The Heaviest Wood.

Another valuable tree, which endures the hot, dry summers of the interior, is the Yate, Eucalyptus cornuta. But this, too, will not stand severe cold, being injured by minimum temperature of 23 to 26 degrees Fahrenheit. It prefers a rich soil with plenty of moisture, but will grow in poor soil, and will even thrive in strong alkali land. The writer has seen it growing in land so strong with alkali that no other tree would grow there, and surrounded by water for several months. It forms a rather bushy, spreading tree except when grown in grove form, when it will grow much straighter. It has been largely used as an ornamental street tree and for windbreak, for which purpose it is probably unsurpassed by any other species. The wood is one of the heaviest of all eucalypts, and according to Australian tests it is the strongest wood in the world.

The following is a quotation from one of the Australian authorities: "As a sawn timber Eucalyptus cornuta, known as Yate, is probably the strongest in the world, being far ahead of the rest of the Australian hardwoods in every variety of test; and in one tensile test with this timber a breaking load of 17½ tons per square inch was recorded, a value only 3½ tons below that usually specified for wrought iron of ordinary quality." The wood is used for various artisan's work and preferred for the strongest parts of carts, wagons and other work requiring hardness, toughness and elasticity.

Will Stand 156 Degrees.

Perhaps a species that will stand more heat than any other is Eucalyptus microtheca (Collibath.) There are not many reports available regarding this tree on our deserts, but it has grown successfully in Arizona wherever it has been tried. It is indigenous to the hot, dry deserts of Australia. Baron von Mueller states in his "Select Extra Tropical Plants:" "It withstands unscorched a frequent heat of 156 degrees Fahrenheit in Central Australia." It also endures severe frosts. The timber is valuable for railway ties, bridges, posts and for general building purposes. The wood is brown and sometimes very dark; hard, heavy, elastic and very prettily marked, and is used for cabinet work to some extent.

The Gray Box.

The Gray Box (Eucalyptus hemiphloia) has been grown successfully in Arizona, never having been injured by the heaviest frosts or the hottest winds. The foliage is more dense than most species, making it one of the best for shade purposes. The wood is hard and tough and in Australia is used for railway ties, telegraph poles, shafts, spokes, plow beams, etc.

Eucalyptus crebra or the Narrow-leafed Ironbark, has also been grown successfully in Arizona. It endures extremes of heat and cold, standing a minimum temperature of 18 to 20 degrees Fahrenheit, and a maximum temperature of 110 to 118 degrees. It is usually a straight, slender-growing tree, attaining a height of about 100 feet. The wood is reddish in color, hard, heavy and durable, lasting well underground and used for railway ties, piles, bridge-building, wagons, fence posts, etc.

IT'S PENNY WISE

Policy to set out a good tree, costing good money, and then let the sun burn the bark or the rabbits gnaw it, when for $1 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow street, Los Angeles.

MERIT WINS.

From an exhibit made by the National Wood Pipe Co., at Albuquerque awards were made which give much satisfaction to that progressive concern. Sales Agent Dennis writes us as follows:

"We are pleased to announce that we are in receipt of diploma of award from the International Industrial Exposition and 28th Annual New Mexico Territorial Fair held at Albuquerque, New Mexico, September 29th to October 10th, 1908. This exposition and fair was held in connection with the 16th National Irrigation Congress. This diploma was awarded to National Wood Pipe Company for best exhibit of wood pipe for City Water Works, Irrigation Systems, Mining and Power Plants.

"In this connection we would state that we exhibited our machine banded redwood and fir pipe. Pipe exhibited was of various diameters and banded for various pressures up to 450 inches head. We also exhibited numerous fittings which are used in municipal and irrigation systems. Our exhibit was located in the forestry building."

NEW NURSERY COMPANY.

The San Fernando Nursery Co., San Fernando, although new to our readers, promises to be one of the leading nurseries of the state. The company already has 25 acres comprising all varieties of citrus and deciduous fruits. They are very nicely situated in the beautiful and fertile San Fernando valley. They thoroughly understand the business and besides fruit trees they grow ornamental trees, roses, and palfs.. They also have quite a large lot of Burbank spineless cactus.

The company has issued a catalogue which will be sent on request if you mention the Cultivator.

TRANSPLANTER.

We noticed recently at the Aggeler and Musser Seed Co., a most convenient little transplanter used for lifting the little eucalypts and other small seedlings from the seed bed and placing in the flats. The Aggeler and Musser Co. have a complete line of all nurserymens' supplies. They are at 113-115 No. Main St., Los Angeles.

TURKESTAN ALFALFA.

The favor with which the new alfalfa, Turkestan, is being received, especially in sections where moisture is scarce, shows that it is making good in a way which prophecies a great future for it. It has many admirable qualities such as "drouth resistance, fine stalks, many leaves and heavy yield. It's a winner and the Germain Seed Co. of Los Angeles say they have some of the finest imported seed which was ever brought to this country.

SECURITY.

An exquisite little booklet is issued by the Security Savings Bank of Los Angeles. Nearly every page in the book has illustrations and it gives a person one of the best ideas of banking which may be had in such a small pamphlet. The offices, vaults, and store rooms are all described and illustrated in detail. It may be had for the asking and is well worth sending for.

A VALUABLE GIFT.

Continued from Page 581.

their value to the commonwealth is beyond calculation." (Bulletin 35 of the Bureau of Forestry, U. S. Dept. of Agriculture.)

Forty years ago Planchon remarked that he saw hundreds of thousands of eucalypts planted in Northern Africa, and that no other tree has so promising a future.

Fifteen years ago, James Bryce, now Minister to the United States from Great Britian, said in his "Impressions of South Africa," "one sees them (the eucalyptus) almost everywhere, mostly in rows or groups about a house or hamlet, but sometimes in regular plantations." And so in parts of India, South America, Southern France and Italy, the eucalypts are proving the saving factor for man's wantonness, foolishness, and shortsightedness.

There are species of Eucalyptus suited to California conditions from which hardwoods are produced for use in every branch of the building and constructive industries where timber is needed.

Not only that, but the Acacia melanoxylon grows with marvellous vigor in good land, and yields a special timber greatly in demand for piano, billiard table, gun-stock, and similar work. So with the Casuarinas, of immense value for fuel, and hardwood purposes, these growing in the driest localities.

Some Eucalypts delight in a dry hillside; some prefer a swamp, while there are others that thrive under conditions midway between these two. Surely a most accommodating family! And yet we in California shall almost monopolize the industry. Some species, are doing well in portions of Arizona, but elsewhere they will not grow successfully.

One almost wearies in reciting the multitudnious uses of the Eucalyptus. In Australian seed catalogues the Sugar Gum (E. corynocalyx) is actually classed with the fodder plants. It is one of the very best for hardwood, posts, poles, etc., and prefers a hilly or well-drained soil, but it has been found that sheep and cattle will feed on it, keeping in good condition, and for this reason additional incentive is given to its extensive planting in arid regions.

The planting of Eucalypts will solve the problem that the bee keeper always has with him. There are species, which properly selected, will give a succession of bloom, every day in the year.

As I write, November 23rd, a tree of E. leucoxylon near the house is in full bloom, 2½ years old, and alive with bees. And what can be more beautiful for grouping or for avenues, than certain species of Eucalyptus, intelligently selected, with a view to the ultimate effect?

Perhaps no better demonstration of landscape effect, both in grouping and in avenue planting, can be seen than about San Mateo and Burlingame, to the west of the railroad, among the rolling hills. This is but 20 or 30 miles from San Francisco, and is evidence of the skill and forethought of some of the old California pioneers, the Stanfords, Crockers, Floods, and others. Nothing in the whole of Southern California can compare with the arboreal beauty and grandeur of this region. These hills, with rich soil, a cool, even climate, bubbling with springs, were clothed by nature with a rich and luxuriant undergrowth, interspersed with groups of magnificent live oaks. Skilled landscape gardeners were allowed a free hand and a long purse half a century ago by these millionaire railroad men. But the owners do not encourage the sight-seer or the Eastern tenderfoot.

Manufacturing Insulator Pins from Eucalyptus.

Henry Miller, the Cattle King of California, over eighty years old, is planting many thousands of Eucalypts on his Mount Madonna home, high up in the "Redwoods" west of Gilroy, and overlooking the Pacific Ocean. Amidst groves of tan-bark, oak, redwood, madrone, and a wealth of trees and shrubs which cover these northern hills may be seen Eucalyptus trees of many species, some already looking down with disdain upon the native trees and racing upwards madly one or two feet a month in their haste to get more sunlight and away from the shade in which they were planted. For the Eucalypt loves sunshine, while luxuriating in the moisture of these rich mountain sides.

What a boon to California are these Eucalypts from the Antipodes! Giving us in twenty-five years a tree yielding as much valuable timber as a native tree would produce in one or two hundred years; and more, because the timber is hardwood.

And yet Henry Miller would not plant these trees if he thought they were to be cut down; he loves a tree; would there were more such!—Leonard Coates.

Varieties of Eucalypts

Species, Varieties and Requirements of Eucalypts. Written for the Cultivator by O. M. Morris of Los Angeles.

THERE is no set or positive rule to be followed with eucalyptus as a demand of the species is not inflexible and often a variety will survive though entirely out of its practical habita. Sufficient knowledge is now at hand and experiments far enough along to pretty well define the range of practical culture of some two dozen or more with a well known species.

In case of temperature there is much to be considered, such as the age of the individual plant, the soil, and particularly the condition of the growth of the individual. If it is thriving and the temperature change comes gradually, it will frequently stand heavy freezing without injury. On the other hand, often a less severe cold snap will greatly damage and often kill them. A locality where the temperature in the fall becomes a low, constant cold one and is gradual, hardens the tree down and it is less subject to severe shocks. The writer has just been convinced very positively of this by having a branch handed him of eucalyptus Rustrata several inches in diameter, grown on the Mojave Desert where the snow often covers the ground to a depth of one or two feet and where their winter temperature is quite as severe as California severity goes, often only a few degrees above zero. There is also considerably written lately concerning the wide range of planting that can be done. While the eucalyptus, in most of its species, reveal also considerable written lately conand climatic condition, there is a boundary to its successful growth, but we believe that it would be possible, by the careful selecting and planting of adaptable species, to cover the greater area of this state with some one of the other of these great and really wonderful trees.

While we all realize that most any of the many species will thrive close to the Coast where the temperature is equitable, this is not so with the mountain sides or hot interior valleys. There the selection of a more hardy and even at times more resistive species, must be considered, while in other cases, swamp loving and even some varieties demanding lime hillsides are to be preferred. All, or most of them, however, thrive far the best on well watered, rich, bottom land. But some, such as Corynocalyx and Polyanthema, will do near the coast on abrupt hillsides among rocks and with but little soil. The former will not stand the hot dry winds, sun or cold of the desert valley or some parts of San Joaquin valley, while the latter named thrives splendidly, withstanding low temperature, the real limit of which we are not able to say. This species, and others, such as rostrata, tereticornis, viminalis, leucoxylon, regnans and Stuartiana will thrive at a very low valley temperature, stand great heat and bright desert sun without injury. Again E. globulus and diversicolor, will come to the greatest perfection near the coast in the cool breeze and fog, both loving good bottom land and plenty of water, the growth on either being only one-half of that on good soil, if planted on hillsides.

Much has been heard lately as in the past concerning the E. marginata. While this tree is one of the most wonderful of the species, it is wholly a failure in our state. After having made large plantings of this species in various places and at different times throughout Southern California and thousands and tens of thousands of plants being used in these experiments, the writer does not know of a good thrifty tree growing in the state. This tree grows on the lime hillsides in West Australia and is known around the globe as the famous Jarrah, the wood of which is worth from eighty cents to one dollar per cubic foot in the native forest but its proper requirements and conditions are not found here. Plantings made in good season gradually disappear. We might mention right here also that there is much land now being planted to some species under climate and soil conditions which are wholly unsuited to the ultimate desired results. For instance, E. rostrata, while its climatic requirements are not so exacting, in fact, being hardy most all over the state, is a species that must have good bottom soil and plenty of water, to obtain anything like good growth. Of all the species we have, this is one of the most crooked and slow growers if planted on hill or dry mesa land, while on the other hand, if planted on rich bottom land, it makes straight and quick growth.

Choice of Species.

Generally speaking, E. globulus, we should recommmend for localities close to the coast on good soil with E. corynocalyx for hills and rough land. Diversicolor, Botryoides are both valuable timbers for planting on bottom lands; the E. rostrata, tereticornis with hot interior valleys.

WOOD PRODUCTION IN GERMANY.

Among all the nations of the world, Germany receives the credit of being the most thoroughly scientific. She does with her limited natural resources what younger nations will soon be compelled to do in self-protection; she conserves them.

When our wood supplies are within sight of their end, and sawmills that have been moved from the white pine belt of the north to the yellow pine belt of the south, have been moved to the Pacific Coast for their last stand. then Germany's scientific forestry policy will receive better recognition.

We do not think of moving a grist mill about from one wheat field to another, as the fields in turn become exhausted. After one crop is harvested another is coming on. So it must be with the sawmill and the crop of trees. If it takes 50 years to raise a tree of a given species, then one-fiftieth of the forest may be cut each year, provided it reseeds or is replanted—and the sawmill stays at the same place and the workmen live in their permanent homes near by; the "lumber shanty" will be a thing of the past; raising trees a business like raising wheat.

Hortieultural Commissioner Pease of San Bernardino county has been given power to create districts within his own county which may quarantine against other districts of the county. This is to prevent the spread of scale and other fruit pests.

Live Stock and Dairy

By Mrs. Minna E. Sherman

ALFALFA GROWING.

"THERE was a man who had to purchase an acre of land in Humboldt county," says a writer in the Pacific Dairy Review, "to put up a skimming station." The land was out in the country and away from the naturally increased values of the towns; it was cow feeding land. Its value? Six hundred an acre.

Now in the San Joaquin valley we would think that a fine price for a well equipped full bearing vineyard. The Fresno Chamber of Commerce has made up the statistics showing that the average income from the vineyards of the county is $100.00 an acre. How great must be the wealth of the dairy when its lands are worth more than vineyards. The profits of a good stand of alfalfa this season in this valley make a vineyardist dizzy to think about. One of my neighbors made the first hay on April 5th, and the last on November 20th. Eight cuttings in all this past season. It is only a few years ago that good alfalfa hay was worth from three and a half to four dollars a ton and was often delivered and put into the barn at $5.00 a ton.

At these prices we found it a cheap supplier of humus to the soil and used it freely to plow under. The stiff red soil that made excellent brick was made free working land by plowing under five or six tons of alfalfa hay to the acre. This was put on the vineyard at the rate of three tons in the spring to act as a mulch and to be plowed under in the winter time. The next summer the mulch was repeated. The saving of expense of constant irrigation on a newly planted vineyard more than paid for the hay used.

Alfalfa Land.

Alfalfa is a long rooted plant and on shallow land does not make a lasting field, neither does wet land make a good alfalfa pasture. The lighter soils are warmer and deeper than the rich red lands and are generally chosen for the alfalfa fields. It is now time to begin to prepare the land for next spring's sowing. In doing this work it is foolish to slight any part, as the seed is too costly to be thrown away. In after years there is nothing more aggravating than alfalfa on a piece of poorly leveled land. Wherever there are hollows big enough to hold water the alfalfa will be killed out by water standing while the sun is hot. The land must be prepared so that it can be cheaply and quickly irrigated. This is done by carefully leveling and checking the land up with small broad levees. Do not cut it up into quarter acre patches. The moving of the earth in these levees that cross small pieces of land will cost more than to make one levee around each two, three or five acres, make the levees at least six feet across and well rounded. The mower should run right over the levee as though it was not there. In the older alfalfa fields these levees will often have the rankest growing plants on them. I saw in the Southern part of the state a series of fields with a center ditch down them to carry off the irrigation water. These were of course simply brown water ways without any alfalfa growing on them. It seemed a waste of land, that a little care in letting in only enough water to cover the ground would have overcome. The levees should have proper head gates to let the water from one check to another. The head gates are numbered in paint as, 1, 2 and 3. These numbers indicate the order in which the water is turned in on the land. If the levees are once cut with a shovel to let the water into the next piece it is only a matter of time until these places wash out and the earth composing them disappears over the surface of the alfalfa. It makes it necessary to haul in earth to rebuild the levee. The amount of dirt it takes when loaded on a wagon and hauled in is appalling and the expense far surpasses the cost of a few rough head gates.

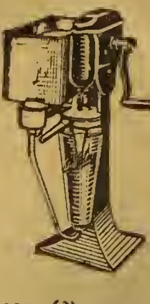
Scraping.

Before starting to fill up irregularities and to make the banks of the checks, the land should be cleaned of foreign growth, all carefully burned to keep from seeding again. Then the land should be plowed three inches deep to completely turn the surface over. This plowing breaks the surface and renders the fills homogeneous. The banks of the checks settle in one mass. If the land is not plowed before making the levees there will remain an unbroken surface under them; when the water is flooded on the higher checks it will often find the smooth surface and seep under the leeves, gradually undermining them. After the checks are built up with the scraper and the holes filled up with earth from the higher spots, let the land lie at rest until the next good rain. If however rain does not come within a reasonable time then irrigate freely; any errors in filling will show and can be corected. The big two disc plow comes into use and the surface is cut ten inches deep and harrowed smooth. In February plow two inches deep and seed and harrow. The earth should be harrowed until it is fine as a garden. The alfalfa seed goes on before the last harrowing and is lightly brushed into the land.

Care in Selecting Seed.

Seed for the alfalfa fields should be purchased several weeks before it is used and tested carefully for vitality. Plant a small amount in a box in a warm place to see how well it germinates. All seed should be carefully examined for mixtures of weed seeds. By taking a handful and spreading it on a sheet of white paper the alfalfa seed can be readily detected without the use of a magnifying glass. The good seeds should be slightly curved and of an olive green color; on the inner side there is a tiny moon shaped scar that held the seed to the side of the pod. This scar is the same as we see on peas and beans generally. The seed mostly feared in the alfalfa field is that of dodder, also known as love vine, or gold vine. This seed is round, of a dull yellow in color, and thin enough on the edges to show somewhat lighter in color. Reject any seed having this in it. If the grower does his duty this seed can be screened out. A hand screen that will let the slender alfalfa through will take it out readily. The vitality of the seeds is easily tested by soaking some blotting paper, four or five thicknesses in water and putting a hundred seeds between the two folds; keep the paper wet and in a cool

Bargain Counter Separators



The so called cheap (?) ones that are offered by Cheap Johns' at bargain counter prices, should never be tolerated; because they are not only worthless but unsafe.

It's throwing money away to buy one. If you are in need of a separator investigate the

place, when tho seeds will germinate within a week's time. Counting those that fail to grow will give the per cent of poor seed. I got seed from two seed men one year and found that in one lot 76 seeds out of a hundred failed to grow, while in the other seed seven out of a hundred failed. The first seed was seven and a half cents a pound the second lot was ten cents a pound. Twenty pounds to the acre with this last seed would be more than is usually sown as practically every seed was viable. —M. E. Sherman.

AMERICAN BREEDERS.

The American Breeders' Association will hold its fifth annual convention in the Middle West in January, in connection with Missouri's Agricultural Organizations at Columbia, Missouri, January 6, 7 and 8. Honorable Willet M. Hays, Assistant Secretary of Agriculture, is the secretary of this society. In a recent interview, he said:

"Next to the conservation and efficiency of the physical, mental, and moral energy of American youth through education which fits them for practical life, stands the problem of utilizing the forces of heredity in the improvement of all forms of life.

"This American Breeders' Association really represents a part of America's great policy of conservation of natural resources. Heredity in plants and animals is a great resource. It is a source of marvelous utility. An idea of how important is the undeveloped heredity in the occasional plant or animal which can project its higher efficiency into a new strain may be had by considering the following facts:

"The United States produces $7,000,000,000 of plant and animal products annually. Of this amount $5,000,000,000 comes from crops and animals, the heredity of which we may undertake to improve. Now it is conservatively estimated that over ten per cent can be added to the value of these crops and animals by breeding, at a cost of one per cent of the increase or at a rate of ten thousand per cent profit.

"In other words, by improving American breeds of cattle, horses, sheep, swine, field crops, fruits and other plants, $500,000,000 clear profit can be added to Uncle Sam's annual income, or $5,000,000,000 every ten years.

WARTS ON TEATS.

It would be best to wait to remove the warts from the teats until the cow has "gone dry." If you can not do this, you can try cutting them off with a very sharp knife, applying a little silver nitrate to the raw surface. Be careful not to get it on the other parts of the animal or on you.

The use of muslin windows instead of glass in dairy construction is said to help materially in the fight against tuberculosis.

Never buy a horse that drags his hind legs. The animal that gives his heels a clean, outward fling that shows his shoes, is generally a good traveler.

When a horse eats dirt, it is no sign that he is sick. He is only seeking that which his system craves. A steady diet of corn in the winter will often cause a horse to eat dirt. A bran mash with chopped roots is beneficial in such cases.

MAKING AND SELLING A MILLION

CREAM SEPARATORS

AND THE KNOWLEDGE GAINED

Thirty years ago Dr. De Laval invented the first practical centrifugal cream separator. Since that time the De Laval Separator Company has manufactured and sold one million DE LAVAL machines. These separators are today in use in every civilized country in the world. They have been operated and criticized everywhere. Through all these years suggestions for their improvement have come by the thousands from every quarter of the globe. These have been investigated and tried out from time to time. The best have been adopted. The 1908 improved DE LAVAL cream separators represent the thirty years accumulation of such ideas and experiences. They represent the knowledge and experience gained through the manufacture and sale of one million machines. If in your lifetime you had milked one million cows, wouldn't you feel that you knew how to milk a cow just a little bit better than someone who had milked but one thousand? That's the way we feel about the cream separator. Our knowledge of its manufacture and practical use is many times greater than anyone else's. If you are thinking of buying a separator can you afford to ignore the knowledge gained by making and selling a million separators? We don't believe you can. We offer you the 1908 DE LAVAL for your most critical examination. An illustrated catalogue will be mailed for the asking. Write for it today.

GUM DISEASE.

A bulletin which will be valuable to citrus growers was recently issued by the State University Experiment Station at Berkeley. It is written by Prof. Ralph E. Smith and O. Butler, and will have great value for every citrus grower in California. Prof. Smith has been long engaged in his experimental work and the contents of the book are valuable for the reason of these experiments in field and laboratory. The bulletin discusses various citrus troubles which may be considered in the category of gum diseases, "showing the features which they have in common and discussing their nature together with methods of prevention and cure." Every citrus grower should write for the book.

SCHOOL OF AGRICULTURE.

The School of Agriculture which is in the nature of a High School will open at the State University Farm at Davis January 5. A circular regarding the school and its work and requirements with illustration of many of the buildings, under the title of Circular No. 41 has been issued and in it is the form of application for admission. This school is for boys only, at least for the first year. If sufficient funds are provided another year, dormitories for girls will be built and provision made for their instruction. The regular course requires three years.

This school together with the one at San Luis Obispo and the one under private management in Imperial Valley, together with the one contemplated at Fresno makes California look as if attention were beginning to be paid at least along the lines of agricultural instruction.

PROTECTION.

At the recent state convention held at Sacramento when the proposition of reciprocity with Canada was suggested, in a resolution that arrangements should be made whereby prunes and other dried fruits might be admitted free to Canada conditional on Canadian lumber being admitted free to the United States, it was opposed by Mr. Adams and others on the ground that the fruit grower if a protectionist at all should remain true to his principles along all lines and not attack any other line of American Industry. Owing to this opposition the resolution was materialy changed and the reciprocity feature largely eliminated.

Now comes the news report from a meeting of 350 representative shoe merchants at Chicago who appointed a committee to appear and press before the Ways and Means Committee the claims of these manufacturers for a good stiff protective tariff on shoes and other manufactured leather products, and at the same time appeal for the wiping out entirely of the tariff on hides. If the action of the California fruit growers in urging reciprocity would have been inconsistent, surely the action of the shoe men is, and it shows the manufacturers of the country would slaughter in a moment if they could the agricultural industries. We think, however, the committee, or at least Congress, will be too wise to ever protect the large manufacturing industries at the expense of agriculture.

REPORT OF THE SECRETARY.

Secretary of Agriculture James Wilson has sent to us an advance copy of the report of the Secretary's office for the year 1908. This is the twelfth annual report since the office was made a cabinet office.

From the report it appears that the farm products for the year 1908 reached the most extraordinary amount io the world's history, the total expressed in dollars reaching the aggregate of $7,778,000,000.

INCREASE ABOVE FORMER YEARS.

The farm value of farm products this year is $290,000,000 above the value for 1907, $1,023,000,000 above that of 1906, $1,400,000,000 above that of 1905, $1,619,000,000 above that of 1904, $1,861,000,000 above that of 1903, and $3,061,000,000 above the census amount of 1899.

And of this total of agricultural production the value of the corn crop is about one-third; wheat, hay, and cotton combined make more than one-third; and the smaller crops the remainder, or nearly one-third.

The crop production for the year is on the whole a high one. Never before was the hay crop so large in quantity, nor the rice crop, nor the sugar-beet crop, nor beet and cane sugar production. The production of barley has been exceeded in only one former year, and cotton has been exceeded by only two years at the most.

With regard to crop values, this year leads all former years in the case of corn, wheat, rice, all cereals, potatoes, sugar beets, beet sugar, beet and cane sugar combined, and possibly tobacco.

CORN.

Greatest of all crops is Indian corn, priceless gift of the Indian, who freely gave to the white man information which led to the production of 2,643,000,000 bushels this year. The crops of three years have exceeded this, but only the crop of one year—1906—exceeded it very much.

The value of this crop almost surpasses belief. It is $1,615,000,000. This wealth that has grown out of the soil in four months of rain and sunshine, and some drouth, too, is enough to cancel the interest-bearing debt of the United States and to pay for the Panama Canal and 50 battle ships.

SUGAR BEETS AND CANE.

In the production of sugar beets for sugar making, this year stands at the top, both in quantity and in its value to the farmer, although in both respects not much above the figures for 1906 and 1907; but, in comparison with the average of the preceding five years, the tonnage of this year is higher by 44.7 per cent and the value, $21,500,000, by 43.7 per cent.

The beet-sugar production from the crop of 1908 reaches a higher figure than ever before, or about 500,000 short tons, worth at the factory, with the pulp, about $45,000,000; this value also is higher than for any preceding year.

The value of the sugar beet and of the sugar cane to the grower, with the addition of such molasses and sirup as are made on the farm and outside of factories, makes a total of about $56,000,000 for 1908.

FIG CULTURE.

In a conversation with Prof. Walter T. Swingle of the Bureau of Plant Industry and with Special Agent Rixford of the same Bureau, much interesting information as to fig culture in California was secured. Mr. Rixford is the man who as business manager first suggested to the San Francisco Bulletin the introduction of fig cuttings which were sent to subscribers of that paper in nearly all sections of Northern and Central California. At first it was thought all of that importation was of no value, because of the fact that the insect which fertilized the blossom of the growing fig was not known to be necessary to its successful growth, Later, on its introduction, many of these proclaimed worthless figs were found to be very valuable, and are today being propagated in many sections of the State. In addition to this importation, Mr. E. W. Maslin, then owning a ranch near Auburn, determined that he would experiment with growing seedling figs, the seed being taken from the highest grade imported fruit he could buy. For the same reason that the Bulletin importation proved a failure, Mr. Maslin's experiments with seedlings proved an equal failure until the coming of the Blastophaga. Mr. Maslin later gave up his place and is now engaged in business in San Francisco. But the trees remain and the ground covered by the trees has now been leased by the Bureau of Plant Industry.

Amongst these trees are many of the very finest quality, some even exceeding in value those introduced by the Bulletin. On the other hand, there are some which show the hybridizing effect caused by the Blastophaga in bringing the pollen from the wild or Capri figs. Likewise some of these Capri figs have proven of great value in that there are many varieties covering the entire year in their fruiting. The cuttings from the choicest of these, both edible and Capri, will be distributed by the Bureau during the coming season, and without cost to the fruit grower but upon one condition, that for every cutting chosen from the choicest of these trees, the grower will plant ten seedlings which will be furnished by the Bureau.

The idea in this proposition is that the idle requests which often come to the Department for free seeds and free plants must be shut off, especially as this experiment is a very expensive one to be carried out. Besides, it is desired to have an extensive test in all sections of the State not only of these seedlings but also as to the advantages of the different sections in fig culture which this experiment will develop. We believe it a very wise provision and trust fruit growers will join the Department in this experiment which may result in vastly increasing the productive possibilities of our State.

Shop Talk

CHRISTMAS—Be sure not to overlook the **Cultivator** in selecting your presents this year. You will find the order blank on another page, which explains itself. By an arrangement you are offered a year's subscription at a reduction of 25 per cent. We also notify the one to whom it is sent it is a present from you and that the paper is to stop at expiration. Send in your order at once, as this is the last week the offer can appear.

CHANGES OF ADDRESS—Many requests to change address of the Cultivator are received which fail to give the old address to which the paper has been sent. Our lists are indexed according to postoffice and it is next to impossible to find a subscriber's name in it without knowing at what office it is received. Kindly bear this in mind when making such requests, so as to avoid the necessity of our writing for the information.

MRS. BASLEY'S POULTRY BOOK.—Cultivator readers who may be desirous of getting Mrs. Basley's Poultry Book can place their order through this office. The regular price of this book is $1.00 of all agents but in connection with a year's subscription to the Cultivator we will make the price $1.75 for both to any except a foreign address.

Agricultural Notes of the Pacific Coast

Northern California

Inspector of Yuba County has ordered large numbers of sheep to be dipped.

Dairy cows of the Sacramento valley are now commanding better prices than for some time.

Federal engineers have recommended the dredging of rivers in the Sacramento Valley.

A new reclamation district is to be organized near Yuba City. It will comprise about 2000 acres.

The Santa Rosa Grange recently observed the anniversary of its founding by entertaining the Pomona Grange.

Experiments are being made south of Willows, Glenn county, in sinking wells to see if an artesian belt may be found.

Wool has been commanding a better price since the election and some sales have been made in Tehama county at 14 and 15 cents.

Nevada county farmers are beginning the use of underground waters, the cheap electricity of the section making possible its use at a low rate.

Oroville Chamber of Commerce united in sending a strong petition to Washington urging the preservation of the existing tariff on citrus fruits.

The demonstration train which recently made such a successful trip through the Sacramento valley is again under way, starting recently from Sacramento.

The farmers at Gridley are taking steps to form an organization for handling the products of members. A committee has been appointed to draft a constitution and by-laws.

It is announced that the California Grape Growers' Association is now fully organized and that work has begun in the endeavor to shape legislation favorable to the wine grape interest.

The Sonoma County Produce Company which is handling the eggs of the Sonoma County Co-operative Poultry Association has been compelled to greatly enlarge its storage and shipping facilities.

The Superior Court of Oakland has declared the State Veterinary law unconstitutional. This is said to throw open the veterinary practice of the state so that any one may now practice without license.

Humboldt county creameries on the last pay day paid for cream deliveries as follows: Central 34¼, Cream City 34¼, Ferndale 34¼, Eel River 33½ Grizzly Bluff 33½, Riverside 33½, Pioneer 33 and Capital 33.

The Water Users' Association of Tehama county is the newest irrigation organization in the state, having just been organized. It has been brought into being by the building of the Iron Canyon irrigation projects. A committee of five has been appointed to draft a constitution and by-laws.

The fact that easterners have claimed the credit of introducing electricity into the hatching of chicks brings Mr. Byce of the Petaluma Incubator Company to the front with the statement that he has successfully hatched chickens by electricity for many months in his store. The first by this company was three years ago at the California State Fair.

Central California

Sanger anticipates the early establishment of a creamery.

Hatfield the "rainmaker" has begun his manufactured rain fall at Crow's Landing on the west side.

Dairy inspector of San Jose reports that he examined 180 samples of milk and found ten below the required standard.

Raisin growers in the new raisin combine have been given permission to sell their layers separately from the association.

Contrary to earlier estimates the orange crop of Tulare county district will be rather light. The reason is claimed to be the heavy June drop.

A new raisin seeding device has just been invented by a Fresno fruit packer. It is predicted that if it proves of worth it will soon be taken up by the trusts.

Some Lindsay orange growers who sold their fruit so as to net them $1.50 per box regret their action as it now appears better prices might have been secured.

It is estimated that the coming increase in the freight rate on dried fruits will take from the fruit men of this state from $350,000 to $450,000 during the next year.

Sanger is shipping about one and a half cars of Thompson seedless raisins daily. One vineyard company doing the shipments has a private trade which permits of regular shipments.

Several ranchers about Tulare Lake where so many ducks have died maintain that the posioning is caused by the ducks eating of the great quantities of loco weed seed that grow about the lake.

The California Creamery Operators' Association will petition the State Legislature to make an appropriation for the use of the State Dairy Bureau which will enable it to employ a force of inspectors to enforce the laws.

On account of oranges not being ripe as desired Tulare county packing houses are waiting for the cool nights to color up the fruit better. The next heavy shipments will be forwarded in time to catch the Christmas trade.

The Hanford Journal reports the formation of the West Side Irrigation Company, articles of incorporation of which have been filed. The purpose will be to take water from Tulare Lake and to convey water to lands along the west side.

At a recent meeting of the County of Pomona Grange of Santa Clara county the following were elected: Master, E. F. Greenwood, Mountain View; Overseer, A. C. Keesling, Campbell; Lecturer, E. T. Pettit, San Jose; Steward, George Culver, Mountain View; Assistant Steward, Lewis Walter, Mountain View; Chaplain, Rose Stevens, Cupertino; Treasurer, M. Farrell, Mountain View; Secretary, M. J. Worthen, San Jose; Gatekeeper, F. E. Mitchell, Campbell; Flora, Edna Keesling, Campbell; Pomona, Eunice Case, Sunnyside; Ceres, Belle Walter, Mountain View; L. A. S., Lucy Derham, Mountain View; Organist, Eliza Farell, Mountain View.

Southern California

The recent rain which aggregated as high in some sections as two inches was most acceptable.

The formal opening of the Imperial Valley Collegiate Institute was held at Heber on Thursday of last week.

The Mission Land Company at San Fernando has received a car of flax seed for planting the coming season.

Several Imperial valley farmers will experiment with the planting of Crimson Winter rhubarb this coming season.

The Tustin Packing Company has installed a neatly furnished rest room with chairs, stove, etc., for the use of its employees.

The orange crop of Southern California is estimated for next year at about 30,000 cars. This will be slightly in excess of last year.

Hog raising in the Imperial valley has been given a decided impetus by the success of breeders in marketing their product during the past year.

Scientific fumigation is being given to many orange trees about Whittier this year quite generally under the direction of R. S. Wolgum of the Department of Agriculture.

There have been occasional cool nights which has given a white frost in several Southern California sections, but no damage except to tomatoes and other tender plants.

Steps are being taken at Beaumont for organizing a canning and fruit drying plant, which is to be co-operative, each grower taking his pro rata of stock and the goods to be shipped under a common label.

Calexico is laying big plans for fair grounds and has formed an Imperial Valley Agricultural Park Association which has decided to incorporate at $25,000 for securing 50 acres on which a mile track will be made.

Eight thousand acres of rich farming land between Spadra and Pomona have been sold recently to Dr. Fundenburg of Riverside. Besides agricultural advantages the ranch is in the oil producing zone of the rich Puente fields.

The business men of Thermal are incorporating to sell a large number of dairy cows to ranchers on time limits. The success of this move in dairying in Thermal district depends upon the interest displayed among ranchers.

The orange packing house at Tustin has installed an instantaneous dryer for drying oranges which have been washed. By the use of this the old drying rack will be dispensed with. The dryer has a capacity of two cars a day.

Complaints against a San Bernardino county rancher for killing quail without a hunter's license developed the fact that under the law he had a right to kill quail within the boundaries of his own ranch without any license. The game warden grants permission to ranchers to trap quail where it can be proved that the quail are injuring crops but where this is done the live quail must be turned over to the fish commission who will pay for them at the rate of $1.50 per dozen. The quail are then used for "planting" in other sections where quail are scarce.

The Coast

Utah is preparing for a greater number of institutes and with a larger institute staff than ever before.

The National Apple Show on the boards at Spokane this week is pronounced to be a complete success.

Dry farmers of Utah are pleased at the deep coating of snow which is covering their farms at the present time.

One wheat grower in the Puyallup Valley, Washington, averaged 72 bushels per acre for his last season's product.

The burden of the requests made to the Country Life Commission by the farmers near Portland, Oregon, was for better roads.

Montana wool growers are combining to help remove the center of the wool trade from Boston to Chicago, or farther west if possible.

Thousands of cattle are dying on the ranges of Colorado owing to the extreme cold weather. Hay is selling at almost prohibitive prices.

A big convention of wheat growers is being held this week at Pullman, Washington. The principal topic of discussion is seed improvement.

The Spokane Chamber of Commerce has completed preliminary arrangements for its second annual excursion to Los Angeles. It is expected to leave February 5.

Ranchers near Riverside, Washington, have signed up 10,000 acres under an irrigation project which will lead to great benefits to the fruit growing industry.

Great preparations are already being made for the live-stock exposition which will begin on the 27th of next September at the Alaska-Yukon Exposition at Seattle.

Fruit growers from all the western states and from Western Canada met in Portland last week for the annual session of the Northwestern Horticultural Association.

The Inland Empire about Spokane, Washington, is organizing a poultry association which will look after the commercial interests, both buying and selling, of its members.

The Farmers' Traction Company of Walla Walla, Washington, has recently completed organization for the purpose of constructing an electric line from Dayton to Wallula.

The Northwestern Fruit Growers' annual meeting at Portland has unanimously resolved against the apple box regulation proposed by the Porter Bill now before Congress.

The Horticultural Society of Oregon, heretofore self-supporting, is making an effort to secure an appropriation of $1000 to cover the expenses of the association for the coming year.

The Institute Lecturing Tour recently given in the State of Washington by a professor from the Agricultural College has proved successful, and was most cordially received by the farmers.

Local merchants at Bellingham, Washington, are pleased over a possible radical adjustment of rates over the Northern Pacific, which will so reduce cost of California fruit, Eastern Washington grain and all other Pacific produce shipped into Bellingham that jobbers of that city will be placed on an equal footing with Seattle and Portland.

Don't Forget Quality

MIDLAND Poultry Food

Is based on ***quality*** and it is quality in Poultry Food that produces eggs. ***Cheap filler*** and ***cheap grain*** will ***not*** make eggs. ***Midland Poultry Food*** contains only the ***choicest*** cereals and animal food the market affords. Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

CHRISTMAS TURKEY.

With Oysters.

Select a nice plump turkey; draw and wash thoroughly. Prepare stuffing in the following manner: Take a pint of oysters; put in a pan and stew in their own liquor; drain off the liquor and cut the oysters into bits; add half cup of butter, a shredded onion and a teaspoonful of powdered sage. Let all simmer together; moisten three pints of stale bread crumbs with the oyster liquor; add the oysters and onion; break in three eggs; season with salt and pepper, and mix all thoroughly together. If the stuffing is too dry add some milk; if otherwise, add more bread crumbs. Stuff the turkey; sew up the opening; take some butter in the hand and rub over the outside; dredge with salt, pepper and flour; put in a pan with a pint of water; baste every ten or fifteen minutes. A large turkey a year old will take from three and one-half to five hours of slow roasting.

Avoiding Dryness.

I have heard people say they really did not care for roasted turkey, as it is too dry.

Turkey cooked in the following manner will be juicy and tender: Dress the bird and remove entrails. Do not wash, but hang in a cool place for four days at least, so the meat will mature. When ready to cook the turkey, wash and singe and lay in a dripping pan. Do not salt now, as it will harden the meat.

Take the wash boiler, put in plenty of water, turn a pan upside down, or set in sticks firmly crosswise of the boiler and set dripping pan on this and cover closely. Let the bird steam until tender. Then remove from the boiler and salt inside and out and fill with bread dressing.

Place in a moderate oven and baste with drippings in the pan; turn and baste often until the bird is a nice brown and the dressing done. Any fowl, even an old one, will be tender and juicy if cooked in this way. The bread dressing is made with stale bread, butter, sage, celery and onions if desired and moistened with water and thoroughly mixed.

BRONCHITIS IN POULTRY.

Bronchitis is an inflamed condition of the bronchial tubes or air passages, and mostly occurs in connection with roup. Indeed, it rarely exists as a separate disease in a fowl. There is usually a quantity of mucus in the throat, quick breathing, discharges from the nostrils, and at times one or both eyes become inflamed; there is dullness and loss of appetite. There are many causes for this trouble. Draughty or even too close houses have been responsible for attacks, while foul air and filthy conditions sometimes bring it on. A difficulty in breathing and noise or rattle in the throat and coughing are sure signs of the disease. Sometimes the noise becomes chronic, and instances have been known where fowls were apparently healthy, with the exception of this noise. The simplest treatment is, two or three drops of spirits of camphor to a teaspoonful of glycerine, two night in succession, which should be followed with about ten drops of sulphuric acid in a pint of the water. Should the birds refuse to drink the mixture, a spoonful of sugar may be added. In more severe cases, three drops of chlorodyne in a teaspoonful of sweet or salad oil should be given, which usually affects a cure.—Farmers' Home Journal.

AIR SLAKED LIME.

With the days of summer gone and with the cool rains upon us, the poultryman begins to have troubles of another sort in his flock, and they are those resulting from such conditions of the weather as accompany chilly and rainy days. Roup is the leading ailment in the flock, and if it once gets a good hold before winter, there will be a great deal of work connected with its eradication through that season, and it is more than likely that it will not disappear until spring approaches.

Many fowls will be swept away, for the disease is very dangerous and also very contagious. The great difficulty in handling and doctoring the fowls makes it expensive, for each fowl has to have individual care. There is a substance that has been found to destroy the germs of roup, and that is air-slaked lime, a cheap and easily prepared article. To prepare it, let the stone lime slake in the air, and when it is in fine condition add a pint of crude carbolic acid to a bushel of fine lime, being careful to mix the substances very thoroughly.

The crude carbolic acid should cost not more than fifty cents per gallon, and it is equally as good as the refined for this purpose. Scatter the air slaked lime and carbolic acid over the walls, floors, nests, roosts and over the yards not less than twice a week. After scattering the mixture over the yards, plow the surface under, and then after raking give another treatment to the then top surface. If a case of roup appears, first remove the fowl and then give those premises a thorough treatment, being careful to see that the yards get a good share, for it is in the ground that the roup germs remain more than any other place. The object is to destroy the germs of the disease. The drinking troughs should be cleansed every day—not simply emptied and refilled.

A pinch of chlorate of potash should be sprinkled down the throat of each sick fowl twice a day, and if it does not get well in less than a week, cut off the bird's head and bury the fowl at once. Hoarse breathing, lumps on the face, foul odor and a cough are all symptoms of roup, a discharge from the nostrils also being noticed. Lumps on the face with swollen eyes indicate a very serious form of the disease, and when a fowl reaches that stage there is little hope for it. It will be quite a saving of time and labor, as well as of birds, to use air-slaked lime, even without the aid of the acid, when the premises and houses are cleaned for fall use, even if there is no symptom of disease in the flock.—Coleman's Rural World.

Incubators, like all machinery, do not run themselves altogether. They need almost constant attention, and the better attention they receive the better the results.

Aermotor Gasoline Engine

Complete with Gearing ready to Attach to Your Pump

$45.00

Will pump all the time, wind or no wind, and deliver as much water as an 8 ft. Aermotor in a good wind.

From 225 to 1600 gallons per hour, depending on height water is to be raised.

Air cooled, uses Gasoline or Distillate.

A reliable, durable engine at a very low price. **Can You Afford** to be without one.

POULTRY SHOWS.

Petaluma, Dec. 16-19, 1908—Second annual exhibition Petaluma Poultry Show Association. H. R. Campbell, Secretary, Petaluma.

Pomona, Dec. 14-19, 1908—Second annual exhibition of Pomona poultrymen.

Fresno, Dec. 16-19, 1908—Annual Show of Fresno Poultry and Pet Stock Association. Geo. R. Andrews, Secretary, Fresno.

San Diego, Dec. 29-Jan. 2—Annual exhibit, San Diego Fanciers' Club, J. F. Goforth, Secretary, San Diego.

Los Angeles, Dec. 30-Jan. 6—Poultry Breeders' Association of Southern California. Dr. C. S. Salisbury, Secretary, Monrovia.

Los Angeles, Jan. 14-18, 1909—The Southwestern Pigeon and Bantam Club at the Made in California Exposition. Mr. Moore of San Francisco and Mr. Frank H. Thomas of Los Angeles will judge.

ALAMEDA COUNTY POULTRY SHOW.

The Alameda county poultry show closed Dec. 6, at Idora park. It was a most successful show, according to the officials.

Cups were awarded at closing for the prize fowls in the National Buff Orpington club's western show, as well as for the exhibits in the Alameda county association's entries. The special awards follow:

The largest exhibit—D. A. Cohen.
Second largest exhibit—Moore & Mann.
Best display—D. A. Cohen.
Best 10 solid color fowls—Henry Berrar.
Best 10 particolored fowls—Alex Aikman.
Best display of Columbian Wyandottes—W. C. Wheeler.
Best display of Rhode Island Reds—Mrs. W. E. Gibson.
Best 10 White Plymouth Rocks—Mrs. F. E. Bemis.
Best pair, male and female—C. J. Siegfried.
Best display, one variety, from county—Mrs. F. E. Bemis.
Best display, one variety, from Alameda county, C. G. Hinds.
Best display, noncup winner—John A. Evans.
Best display other than Alameda and Santa Clara counties—Manuel Roberts.
Best display, Contra Costa county—Manuel Roberts.
Best display from southern California—Alex Aikman.
Best display, Alameda—D. A. Cohen.
Best display, Berkeley—W. C. Wheeler.
Best display, Fruitvale—James Stansfield.
Best display, Elmhurst—F. E. Ross.
Best display, Niles—Mrs. W. E. Gibson.
Best conditioned bird in show—Mrs. D. A. Robertson.
Class 1—(a) Moore & Mann.
Class 1—(b) James Stansfield.
Class 2—B. A. Cohen.
Class 3—(a) Manuel Roberts.
Class 3—(b) H. C. Scrutton.
Class 4—(a) W. S. Sullivan.
Class 4—(b) Henry Berrar.
Class 5—Mrs. D. A. Robertson.
Class 6—C. J. Siegfried.
Class 7—F. L. Hall.
Class 8—(a) George England.
Class 8—(b) Alex Aikman.
Class 9—Moore & Mann.
Class 10—D. A. Cohen.
Class 11—V. G. Huntley.
Class 12—D. A. Cohen.

Special cups given by the National Buff Orpington club:

Best display—W. S. Sullivan.
Best cock and best hen—W. S. Sullivan.
Best cockerel—H. W. Gessner.
Best pullet—John J. Dean.
Best pen—John J. Dean.

All the successful poultrymen feed alfalfa; many of them every day in the year. Some feed alfalfa meal; some alfalfa leaves, and others alfalfa hay, allowing the hens to pick off the leaves and reject the stems.

Get Your Share OF THE High Priced Eggs BY FEEDING Coulson's Egg Food

IT TURNS FAILURE INTO SUCCESS, by enabling you to secure eggs in the fall and winter while prices are high.

Improvements have been effected in the composition of the **EGG FOOD** during the past year so that it is now richer in the various nutrients required by the laying hen, and is a better feed than ever before. Proof of this is had in

Actual Results

By Lewis Herbert of Penn Grove, (near Petaluma, Cal.). Began feeding 1900 hens **COULSON'S IMPROVED MASH EGG FOOD** April. Profits for each month over cost of feed:

May	$125.00
June	125.00
July	200.00
August	240.00
September	170.00

October 15th was clearing over $6.00 a day. Feeds 1¼ sacks **IMPROVED MASH** and 1¾ sacks of wheat a day.

COULSON'S BALANCED RATION POULTRY FOODS ARE GUARANTEED to contain nothing but wholesome ingredients. **OUR GUARANTY IS BACKED BY A $500.00 BOND** deposited with the Petaluma National Bank.

We have agents selling our Poultry Foods in nearly every town in California. If you can not obtain what you want from your dealer, write us and we will tell you where to get it.

Order early as the first orders take the pick of several. hundred birds. Prices on application.

After January 1st. we can furnish hatching eggs from our S. C. White Leghorns, the best laying strain in Southern California. Let us book your order now.

STUHR-WILLIAMSON POULTRY COMPANY
378 Bandini Ave. Home Phone 1490 Riverside, Cal.

Trap Nested White Leghorns

I trap nest every bird one year before I put them in my breeding yards. and no bird that has not made a record of 13 dozen or better per year as pullet is used. I cannot afford to breed neither can I afford to sell eggs from a hen that has not made this record as a pullet. I mate 15 hens to a well matured cockerel or yearling cock bird. My breeders have roomy yards, thus assuring strong fertility. A few choice cockerels for sale.

Eggs $1.50 per 15; $7.50 per 100; $60 per 1000.

CHICKEN CHAT.

Hygrometer Gauge.

I would like to ask you through the columns of your valuable paper how to use a Hygrometer, or moisture gauge in an incubator. Do I place it on the eggs? The moisture gauge is marked normal at 65 degrees. What should it register in the incubator when the moisture is right? I would like also to ask how much each of blood, meal and charcoal to feed to 100 hens. Can you tell me how to make a gauge to measure the rainfall? —Subscriber, Douglas.

The only Hygrometer I ever owned had directions for use plainly printed upon the side, and was to be hung upon the inside wall of the machine above the eggs. I laid it on the mantel above the machine and forgot all about it, so cannot give any suggestions about its use.

My way of using blood meal is in the mash food which I mix thusly: 50 pounds wheat bran, 25 cornmeal, 10 pounds alfalfa meal, 10 pounds oil cake meal, 25 pounds shorts, 10 pounds blood meal, ½ pound salt and one ounce red pepper. This I mix with milk into a crumbly mash and feed four big gallons once a day to 100 head of fowls. Feed wheat or cracked corn once a day, one handful to each bird, and green food of some kind once a day.

One-half ounce per day of the blood meal is none too much for a laying hen, but with milk less is required. Charcoal should be kept before them at all times.

If no milk is available add 10 pounds granulated milk to the ration. This mash mixture can be fed dry in hoppers, but I fancy they waste it.

Do not know how to make a rain gauge.—Mrs. F. M.

A rain gauge which is fairly accurate is improvised of the common five gallon oil can with top cut out clean. It is not as accurate as the graduated gauge but with a good ruler to measure it gives approximate figures. Whatever you use, it it must be straight sided.

* * *

Pigeons—Hares.

Please tell me how much in weight, the average pair of working homing pigeons will eat in one year, when fed principally on the following grains; wheat, Egyptian corn, peas, cracked corn, etc.

Is there any profit in raising Belgian hares or allied species, for the open market? Any information regarding them will be appreciated.—D. D., Morganhill.

If fed carefully 50 pounds of grain should keep a pair of pigeons one year when not confined too closely. Have never been able to find regular market quotations on Belgian hares, and believe there is not enough call for them to make the raising of them for market profitable, but they are very nice to keep for home use, and can be salted down and kept for some time in cool weather.

They multiply so rapidly, that one can always have fresh meat, when one has a nice rabbit hutch, well stocked.

If you can find a few regular customers for them, it would seem to be a good money making proposition, but the trouble is, not to "first catch your hare" but to first be sure of your market, then raise your hares.

* * *

After Molting.

During molting period should hens be fed bran mashes as soon as new feathers begin coming in or how soon? At what age should young Leghorn pullets be turned in yard with laying hens and be fed egg foods, same as older hens?—E. V. S. N., Glendora.

The bran, meal and meat mashes are useful all through the molt as the drain upon the system is very great, and more and richer food can be safely fed at this time. All that should be with held at this time is the red pepper, and a little of that won't hurt occasionally. Pullets do best in a yard by themselves, but can have the egg foods from three months old in moderation and full feeds of it from 5 months old on.

* * *

Incubators.

What months are considered the best in practice to bring off an incubator hatch of chicks, January, February or March, and what is their respective advantages in regard to early laying?—W. A. B., Oakdale.

January, Feburary and March are all good months for bringing off broods of the large breeds of chickens, giving them full and plenty of time in which to mature, but April and May are better for the Leghorns and small breeds, for if hatched too early these pullets will lay a few eggs, then molt, and not lay any more all winter. Sometimes the large breeds do this if hatched before March, but a great deal depends upon whether they have been fed egg rations or not.

An early separation from the cockerels will also delay the laying better. Pullets from the large breeds make better layers if they can be kept from laying until eight months old. Leghorns and small breeds should not lay until six months old by rights, but many of both lay at from 4½ to 5½ months old and never make as good layers as the less precocious ones. Now, I will modify that "never" and say, well, hardly ever.

* * *

SUCCEEDED WITH TURKEYS.

I think I have read about all of your "chicken chat," and am waiting for more. Yes, I think New Subscriber did quite well with her turkeys. Having had some experience with turkeys and as you are asking methods of feeding, I will tell you how I feed and the results therefrom. To start with we never brood turks the natural way, but use the cold brooder, which gives far better results. The wobbly little fellows are taken from the hen whether turkey or chicken hen, and dusted with insect powder, and the bedding in the brooder is also dusted, then the turks are placed in the brooder and allowed to snooze for the next 24 hours. The next morning the brooder door is opened and out they tumble. (usually).

Then they get their first meal which is a light one, as they do not eat much the first two or three days, and is made as follows:

Stale bread 40 per cent, hard boiled eggs 40 per cent, onion tops 10 per cent and lettuce 10 per cent. This is ground fine in the kitchen grinder, mixed and sprinkled with sand.

The turks are fed four times a day on the same ration for the first three weeks, then we gradually shift them on cracked wheat and cottage cheese. This is fed until they are about eight weeks old. After this they are fed wheat, barley and beef scraps from a hopper. They are let out of the brooder about 20 minutes at a time at first. After they have learned to go in when cold the brooder door is left open all day and they are out more than they are in.

As soon as the turks are strong enough to run about, the brooder is set out on the lawn, where they can pick clover and "put-put" at every thing that comes along. This in fair weather only.

In bad weather they have a corner in the kitchen, not far from the stove.

Three hens and a Tom composed my breeding pen last year. From them 53 turks were hatched during March, April and May. The hatches run about 90 per cent of all eggs set. Two turks were weak and one drowned in the ditch; the remaining 50 were raised to maturity and all sold except the hens and a young tom, which weighs 30 pounds at eight months of age.

The average price received was $5.00 each. The hens began laying in November and two of them are sitting now.

Now, I have told you how I raise my turks, and the truth of the matter is, my wife raised all of them, for the hens take up most all my time, man-like isn't it? Yours for "Chicken Chat."—D. H. Hammons, Highlands.

Hats off to Mrs. Hammons, and three cheers and another for the man who knows a good wife when he has one, and is not afraid to give credit where credit is due.

While speaking at Thermal a man in the audience asked how to raise young turks and I began giving about the same directions as did Mrs. Hammons turkeys so much good, but he said, "it wouldn't be practicable for him as he raised 1100 the last year." I asked him to tell us how he did it, as he certainly should know better than I, but he refused although Mr. Neff and the audience seconded my request. Said he wasn't prepared, and wouldn't give us a word, but after the meeting was over, I was told that his wife had raised all those turkeys, not he, and as she wasn't at the meeting, of course he wasn't prepared to tell how she did it. As nearly as I could find out, they fenced off about forty acres and let the turkeys run almost wild, but the care of 1100 turkeys was certainly an elephant no matter how the work was simplified and their account would have been very interesting.

In Ashville, N. C., is a 3000 acre poultry farm owned by one of the Vanderbilts, and the manager told me they let their turkeys run wild, and when they wanted one, the only way to get it was to shoot it. This probably furnished sport for the Vanderbilts, but wouldn't do for "we-uns," very well.

Well, this nice batch of letters has taken up all of our space for this week so the brooder chicks must wait for another time. Now, New Subscriber and Mr. Hammons have broken the ice telling their experience so come in and swim, "the water is fine," and tell us all about poultry raising in this grand country. These articles are being copied so we know they are good.

Three hundred thousand chicks etc. seem like a lot to sell, but the Pioneer Hatchery Company of 112 E. 8th, Los Angeles, expects to sell even more than that in 1909. Send for their free price list on chicks, ducklings, turkeys, goslings and thoroughbred eggs.

Growing Eucalyptus from Seed

Written especially for the Cultivator by P. B. Estrada of Los Angeles. Mr. Estrada has had many years experience in the nursery business and is a close observer of the habits of the Eucalyptus.

THE following general instructions regarding outdoor production of eucalyptus seedlings apply to the hardier varieties but describe a system which is handled by some successful nurserymen who have produced hundreds of thousands of trees through this plan of management. In following it, less trouble will be found with "damping off" than is usually the case where grown under glass or in the lath or cloth house. Many a failure has come to those who do not know how to sow their seed and when to sow in order to secure the right size for planting at the time when they should be put into the open fields.

For Fall Planting.

Some prefer the fall planting and some the spring, and complaint has been made about getting trees either too big or not sufficient size to get them transplanted into the open ground at the proper time.

Those who wish to plant in the fall should sow the seed of rostrata and tereticornis in May or at latest by the middle of June. These trees are of slow growing character and in order to get them large enough for planting, say in the latter part of November or in the month of December, later planting than the middle of June would result in the trees being very small and more susceptible to winter frosts. The globulus is a much more rapid growing tree, hence the planting of the seed for them may be deferred until July, when they will be practically the same size as the earlier sown rostrata and tereticornis.

Spring Planting.

In sections where heavy frosts prevail, the spring planting is perhaps the safer. In that case, as early planting as possible should be made, especially if there is no opportunity of summer irrigation. In such a case care must also be had as to deep planting. Some go so far as to plow deep furrows and plant the trees in the bottom, so that later cultivation gradually fills in around them. This puts the roots so low in the ground that they get the benefit of the lower soil moisture.

Seed for this spring planting should be sown during the months of July and August for the slower growers while the blue gum with its rapid growth may be planted in the latter part of August or the earlier part of September. This will bring these trees about to proper planting size, say 8 to 12 inches, for the March and April planting.

The above named varieties I consider may be grown out of doors without the protection of lath or cloth.

Sowing Seed.

This manner of growing the seed in the open is very simple and does not require any great skill or particular attention other than such intelligent care as the ordinary grower may be able to give them.

Make a box 3½ or 4 feet wide and of any length desired. It should not be made wider than that, or weeding and work with the plants will necessitate breaking some of them in order to reach to the center. Fill about 6 inches with good soil, then pack down with roller or by tramping so as to get a solid bed with smooth surface. Scatter the seed evenly, the same as if sowing in the small flats used in the propagating house. After the seed is sown, spread with a fine sieve a layer of sand, say one sixteenth of an inch thick, which will be sufficient to hold down the seed. Over the sand lay one thickness of burlap, then with the hose give a thorough wetting through the burlap. The sides of the box should be higher than the top of the soil, so that after the burlap is so thoroughly wetted that it will lie snug on the sand, the spray nozzle may be removed from the hose and the entire surface flooded. With such treatment it should not require wetting in ordinary weather for three or four days. In cool and cloudy weather it may run six or seven days, but care must be observed if it is extremely hot to give almost daily wetting.

Another Way.

Some prefer growing the seed in the open trench. In such case, proceed by digging off the top five or six inches for the size bed desired. This soil in the bottom of this trench may then be spaded and raked level, after which it should be tramped or rolled with a lawn roller to firm the bed. The seed is then planted, covered with sand, burlap spread over, which, after sprinkling, will permit of flooding just the same as in the box, and at much less expense. In fact this is usually preferred to the box method. In three or four days, the seed will begin to germinate, and at this time the burlap should be occasionally lifted to be sure that the young sprouts are not coming through and being injured by the keeping covered with the burlap longer. After removing the cloth, great care must be exercised in flooding so as not to wash the sand away and the young plants be lost.

Transplanting.

Instead of leaving the seed in this flat or in this trench until ready for the field, it has been found much better to transplant generally into a flat. After they have grown to the height of two or three inches they may be removed into the ordinary flat which is usually about three inches deep, and if about 18x18, will hold 100 plants. This may be done with the ordinary trowel or with the "transplanter."

In transplanting it will be well, especially in warm weather, to shelter these plants for a day or two. But this must be done so as not to exclude the air, as they should have all the air possible. The point of this protection is to prevent the extreme heat of the sun from wilting before the rootlets become established. After this two or three days of protection, they may be removed into the full sun light, as they were before transplanting. Care should be used to remove a small ball of soil with the roots and for this reason the transplanter is preferred to the trowel, although with care the trowel may answer. After the balls are placed in the flat the spaces between should be filled with sand or a light loam soil.

Field Planting.

The time of planting the field will vary according to climatic conditions or the locality and as to whether they receive irrigation. If the spring planting is followed, get in the ground as early as possible and still not be caught by the later frost. As noted at the beginning of the article they should be planted deep and if the furrow system is not followed and they are planted on the level, then extra care should be used that the roots are at least two or three inches deeper than they were in the flats. This soil need not all be filled in when they are first planted, for later cultivation will tumble the ground down about the roots.

They may be planted 6x7, 7x7 or 6x8 feet apart. On good soil where moisture is sufficient they may be planted 4x4, then each alternate one may be removed after two or three years. The wood in the poles will pay for the extra care they need.

Every Blade Tested

Like all the famous Keen Kutter Tools and Cutlery—not a single Keen Kutter Safety Razor is sent out until it is worthy to uphold the well-earned reputation of the name. Every blade is tempered, ground, honed and tested until it will cut a hair at any part of its edge. The

KEEN KUTTER
Safety Razor

is the only one adjusted to give the sliding stroke that cuts the beard clean and smooth without pulling.

The angle of the blade is exactly right to cut close without scraping.

The quickest, closest, smoothest, most comfortable shave—any time—any where—is assured with the Keen Kutter. The Keen Kutter Safety Razor is guaranteed.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths, Fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Cut Worms.

Is there any effectual method known for destroying the small worms that do damage to the tomato crop? It is not the large tobacco worm that eats the vines to which I refer, but a striped worm an inch or more in length that eats the fruit, often cutting it loose just under the stem. Also give me remedy for destroying the worms in the potato crop. They were bad in the tubers of the spring crop and have greatly damaged the vines and tubers of the fall crop.—J. M. B., Anaheim.

The small worm mentioned as injuring tomatoes belongs with the cut worms and army worms. I have had it reported from several sections of the south recently, but it has never occurred in very great numbers. It is not a very easy insect to handle and the only means of control which I would suggest would be in the use of arsenated bait, this consisting of bran, arsenic and cheap molasses, in the ratio of one pound of arsenic to eight or ten pounds of bran and one half gallon of molasses; small handfuls of this being scattered around among the base of the vines where these insects are giving trouble. The proper precaution should be taken, of course, with reference to poultry.

The worms infesting the potatoes I infer are the well known potato worms which do serious injury to the potatoes in the north, and have also been reported to me from one or two sections here in the south within the last month. This insect lays its eggs either at the base of the leaves on the vine or upon exposed tubers, the larvae, or worms, hatching from these eggs, in the case of those on the vine, bore down the stem and in the case of young vines may kill them outright. The larvae hatching from the eggs on the tubers bore into these and complete their larvae life within the tuber, coming to the surface to spin a cocoon and undergo pupation. It is often, however, in storage that the potato worm does the most serious injury. A few infested potatoes may be sufficient to infest the whole lot in storage in a short time. These insects may be handled in storage by the use of carbon bisulphide, the sacked potatoes being placed in air-tight rooms or bins and the carbon bisulphide placed in saucers near the top of the room, used at the rate of one pound to one thousand cubic feet of space. This will effectively kill the moths and usually most of the eggs and pupae. But in some cases it will be necessary to repeat this fumigation in the course of two or three weeks to kill those that may have escaped in the first operation. Nothing satisfactory can be done to control these insects in the field excepting precautionary measures. The potatoes should not be left exposed in the field after digging, particularly over night, since the moths are most active in the late afternoon and early evening, during which time the eggs are deposited on the tubers. In the case of those in the vines, the only thing that can be done is to destroy the infested parts.—H. J. Quayle, Entomologist, Plant Disease Laboratory.

Pruning Deciduous Trees.

Can I prune deciduous trees this month without injuring them? Most of them still retain their foliage. Were planted in 1906-7.—Old Subscriber, Santa Barbara.

We would prefer that trees should become more dormant than many of them are at this time. January is plenty time enough for the pruning, and unless special reasons for immediate work, would advise deferring until more of the leaves drop.

Pruning Grapes.

Please give information as to pruning Tokays, Cornichons and Emperor grapes.—E. J. T., Fresno.

Mrs. Sherman gave some general information on pruning in the issue of November 26. But to give explicit directions regarding pruning in general would require more space than commanded in this department. We therefore refer the question to Mr. Mills, who will later write an article along that line in the Deciduous Department. It is yet rather early for this pruning and there is abundance of time before spring growth would start.

Walnuts—Almonds.

Please let me know through the Cultivator (1) what kind of walnut trees is best for this locality and (2) what kind of almonds should I plant? Also what will be their yield when in good bearing?—C. H. C., Hughson, Stanislaus county.

The present planting of walnuts in the central and northern parts of the state is Franquette. This variety blossoms later than the southern soft shell varieties and in that way is better adapted to your section. If there are any walnut trees near you that are bearing large crops of good walnuts you will likely get better crops by propagating from them than by bringing in something that has not been tested where you want it to grow.

Any nut grower in Stanislaus county or near there who can give explicit directions as to varieties that have done best in that vicinity will confer a favor by sending to the Cultivator their observations. The IXL, Ne Plus Ultra and Nonpareil are all of the very best varieties. The value of the Jordan and many other varieties is not yet fully determined.

Spray Pumps.

Where may I secure hand-spray pumps which will spray the distillate and water, mixing it as the spraying is done?—E. Y. B., Orange.

If you mean by your query the keeping of the distillate and water in separate vessels and spraying the mixture which is formed in the nozzle we do not believe there are any such pumps. Mr. Kahles of Montecito at one time perfected a power-spray pump to handle liquids in this way, but the power-spray pumps made at present handle the distillate and water in the same vessel with an agitator which keeps them thoroughly mixed all the time the spraying is done. For hand pumps we think you would have to provide for the agitation by some method outside of the pump. The hand pumps may be had of any seedman or farm-implement dealer advertising in the Cultivator.

English Walnuts on Moist Land.

Please inform me if English walnuts will grow in adobe soil with sand bottom and water three feet from surface in winter and five feet in summer. It also has some white alkali. Would the paper-shell walnuts bear better than the hard-shell variety?

AUCTION SALE

65 DAIRY 65 COWS

6 HORSES—10 HOGS

On the J. W. Kent Ranch one-fourth mile south of **Graham Station** on the Long Beach electric line 1 mile north of Watts. Take Watts local cars to Graham Station.

Tuesday, Dec. 29 at 10 o'clock a. m.

65 fine dairy cows, Jerseys, Holstein and Durhams, all large fine catle, fresh and coming fresh, large rich milkers, young and in good condition, in fact a choice herd of dairy and family cows.

10 head hogs; 1 four year old draft horse, 1 three year old draft horse, 1 yearling filly, 3 work mares from 4 to 10 years old.

Implements; 1 set double harness, nearly new, 2 sets single harness, 1 single buggy, 1 two-seated surry, etc., etc.

I am closing out my entire herd and quitting the business and every animal will positively go to the highest bidder. No limit or reserve.

Terms: 6 months time will be given with note and approved security on sums over $50. 3 per cent. discount for cash on time sums. Free lunch at noon. Don't miss this genuine closing out sale.

Percheron Belgian German Coach Stallions and Mares

Our last importation of Percheron, Belgian and German Coach stallions and mares arrived in our barns August 1st, among them the prize winners of France, Belgium and Germany, and we can show buyers over 200 head of high class stallions, which we will price as low as any reliable importer can, and give liberal guarantee and terms. If your locality needs a stallion, write us.

J. Crouch & Son

1309 J St. Sacramento, Cal.

Would hickory nuts grow here?—X. Y. Z., Highlands.

If the water table is fairly regular and does not vary more than the two feet which you mention, it is very probable that walnuts would do well. Conditions are not ideal, as would be the case if the water were six or eight feet at all times from the surface. As to alkali, if it is the white alkali and in only ordinary quantities it would probably do no material injury. The paper-shell walnuts are now superseded almost entirely by the soft-shell, and are vastly superior to the hard-shell. We have no knowledge whatever of the hickory having succeeded in this State.

Vineyard Stakes.

Please repeat the treatment given for stakes of cotton wood, willow, etc., to preserve them so that they will be of service in staking the vineyard. You formerly stated that a 6 to 10 per cent. solution of copper sulphate was the proper proportion. Can the work be done at this time of year? The Cultivator suits me to a T. Would not be without it.—F. H. C., Corning.

We should imagine this would be the most favorable time of the year to cut the soft wood. It would certainly contain less sap than in the springtime. A practical farmer in the office as we write says he prefers to cut them now, allow to season until quite dry, then soak for about ten minutes or longer according to the size of the stake in boiling creosote. The creosote may be secured from the nearest gas works, and should be allowed to penetrate the stakes as high as they will be deep in the ground. The time to allow them to soak can be determined by cutting through to the heart of one or two of the stakes to observe the penetration.

Stock for Orange Trees.

Are orange trees ever grafted on grape-fruit stock, and are they a success? Are they as good as the sour root? And will they grow faster than on the ordinary sweet root?—Cultivator Reader, Garden Grove.

Pomelo, or grape-fruit root, is one of the favorite stocks for oranges. It gives a very thrifty, strong-growing young tree.

On damp or very heavy soil we think we would prefer the bitter or sour orange. As a rule, the greater number of our citrus trees are grown on the ordinary sweet root. The pomelo stock furnishes a slightly stronger-growing tree than the ordinary sweet root. Sour root has the preference on the part of many because of its exceptional root system, which is the largest of any of the stocks.

Orange Culture.

Please give reliable information regarding orange culture. What month is the best for planting seed-bed stock in the nursery preparatory to budding? Should budding be done the same season they are put in the nursery row? What month is the best? Please give some directions for preparing soil for the nursery.—Subscriber, Santa Ana.

To fully cover the questions asked above would require a good-sized volume, and we would refer the reader to Wickson's California Fruits or Home Citrus Fruits, which may be supplied by this office. But in a word, transplanting of seed-bed stock into nursery rows in the open should be in March or May. They may then be budded, at least the stronger-growing of them, the following fall, say early in September, while the sap is still flowing strongly. The smaller ones and those which do not "take" with that fall budding may then be budded the following spring as soon as the sap starts to flow, when the warmer weather begins. The soil for nursery should be prepared the same as for any garden or intensive-culture crop; that is, well fertilized, deeply plowed, sub-surface packed, and the surface thoroughly fined by liberal cultivation and harrowing.

Absorbent for Stables.

Which will give best results, Thomas phosphate at $22.50 or land plaster at $9.50 per ton, to use with stable manure for applying to orchard.—W. T. A., Pomona.

Some prefer to either of these superphosphate; but as between the two which you mention for the purpose you mention we think we would prefer the land plaster, which if you buy in any quantity should be secured for less than the price you name. Gypsum or land plaster has wonderful absorbent power, and is claimed by some to have value in releasing or making available the potash of the soil.

Stiff Calf.

I have a calf fed on skim milk. He has been stiff ever since he was a month old, one month ago. Sometimes he is so stiff that if he is lying down at feeding time he cannot get up to take his milk. Can you tell me what is the cause? I have lost several already and would like to know what to do for him.—Subscriber, Lemoore.

Call in a good doctor to see these ailing calves. The trouble may be rheumatic or it may be blackleg or it may be meningitis; any of these would show the symptoms given. For blackleg, vaccination is the best thing; for rheumatism a warm blanket and shelter, while for meningitis the cure is to clean thoroughly all the surroundings and disinfect them carefully. Remove the well calves to fresh quarters. The sick ones should be kept warm and given only sound food, sweet skim milk and a little bran. The doctor will prescribe a tonic that is proper in these cases. I should certainly see the calves had their milk warm and with a rennet tablet dissolved in warm water added.—M. E. S.

Asparagus.

How should an asparagus bed be treated? Have a year-old bed which is bearing all the while; cut it back and nearly killed all my plants.—T. H. S.

You should have ceased cutting early in July, and allowed the stocks to grow so as to maintain healthy condition of the root system. Then late in the fall you should cut off the matured stocks and burn them—unless you want the seed. It is a great mistake to cut a young bed too freely. After being well established, they can be drawn upon more freely. The bed should have an annual dressing of stable manure, say in February.—Q. A. L.

Vetch for Green Manuring.

I wish to sow some vetch for green manuring, but cannot sow before I prune, and cannot prune before the sap goes down. How late may I sow and still be able to plow under and cultivate by March or before? Also what value would pomace from grapes be and how much should be put to the acre? Where can I get vetch seed, and how much will it cost, and how much of it is required?—B. C., Lodi.

It is now too late to sow the seed if you wish to plow under as early as March, that is, too late to get the best growth. But if you have water for irrigation we would advise sowing at once, irrigating the land prior to sowing, and then leave in condition so it can be irrigated late, in which case you may plow as late as April.

Vetch sown now will then be heavy enough to give good crop for plowing under. If irrigated, you can plow under in good condition in April. The vetch seed may be had of seedmen advertising in the Cultivator; probably all of them handle it. It will cost in the neighborhood of 4 cents per pound and will require 30 to 40 pounds per acre. Hereafter, plant a month or two earlier than this, then do your pruning regardless of the vetch. The tramping and dragging out of the brush will do but slight injury, or at least will leave sufficient to do you good enough to more than offset the injury to the crop. As to pomace, we have no experience, and would ask growers who have used it to report. Your poultry queries will be answered later.

Poultry Manure for Vegetables.

How may I best handle manure from poultry-houses so as to get results from vegetable garden? I have a

MORE ABOUT PARCELS POST.

Mr. Emil Staheli of Corning writes regarding the parcels post as follows:

I was much interested in communications of your "Stockton Subscriber" concerning answers to questions from "Country Life Commission." My answers would almost read like a copy of his, and I wish to add that it is not only the farmer that needs a parcels post; the country merchant that fights it is simply hypnotized. One year after the establishment of a good parcels post he would feel as if his very existence depended on it.

Here is a sample of post rates for packages in Switzerland and Germany.

Switzerland: Package, 1 lb., 3 cents, 1 to 5 lb., 5 cents, 5 to 6 lb., 8 cents. 10 to 20 lb., 14 cents, 20 to 30 lb., 20 cents.

Germany: Up to 10 lbs., 10 miles or less 6 cents, over 10 miles 12 cents. Heavier packages are charged according to distance and weight.

Imperial Valley Lands have a greater earning capacity per acre than any land on earth. For price list and information address, James S. White Jr., and R. A. Holt, Holtville, Cal.

CHRISTMAS LONG AGO.

The snowflakes on the sleeping earth
their downy mantle fling,
While clanging through the frosty air
the Christmas joy-bells ring.
It is the hour of eventide—the glowing
fire burns low,
And in its depths fair pictures gleam
of Christmas long ago.

I see the little cottage nestled close
behind the hill;
To us it was a refuge sweet from
every earthly ill.
The blazing logs upon the hearth give
forth a ruddy sheen
To tinge the frosted panes bedecked
with wreaths of evergreen.

I see the little stockings hung beside
the ingle nook;
I see the childish faces—oh, how gay
and bright they look!
While from the little trundle-beds
their merry voices hum,
As eagerly they wonder just "when
Santa Claus will come."

How busy were our mothers then
from morn until they slept,
And from the quaint old kitchen spicy
odors upward crept
From shelves all groaning 'neath the
pies of pumpkin and of mince—
Such appetizing goodies have I never
tasted since.

Dear faces that I see tonight have
gone beyond the skies,
For them the joyous Christmas Day
now dawns in Paradise.
But they seem to hover near me in the
firelight's fitful glow,
Sweet spirits of the Christmas-time,
dear Christmas long ago.—Leslie's Weekly.

HINTS FOR CHRISTMAS DAY.

NO day in the year calls louder for a cheery home table or suggests more simple ways for brightening it than the one we honor on the 25th of December. It is a thousand pities to make any formal observance of Christmas, either by conventional courtesies or by over-costly and burdensome gifts, a weariness to the flesh and a time to be thankful for only when it is well over! This is in a very special sense the festival of loving hearts, the day to celebrate with all simple and natural joy and innocent merry-making.

What a shame to make it lose its real character and its deeper influence for strengthening all that is good and true in the family life by any mere vulgar social rivalry or pretension! It is certainly a day when we should remember that "charity begins at home," however wide the circles may spread from that center of genuine love and good-will.

There are no Christmas decorations prettier or more suitable than the simple arrangement of evergreens and red berries to be had without cost by everybody in country places. Holly has become so great a favorite for this use that it is now sold in every town and village, but it need not supersede the native pine and other evergreens growing over the mountains. Next to these, or in addition to them, may be put for general use the very effective ornaments of red and green paper now so much seen. Christmas bells and chains, individual favors and baskets and the like in dainty crepe paper, with holly in every form, from the simplest card to the richest ribbons make gay and light decorations easily arranged and both pleasing and inexpensive. The Christmas dinner would be incomplete without the touch of Christmas color.

The turkey has long been the American first choice for a main dish at Christmas as on other high festival occasions. But domestic turkeys have grown scarce and high in all our markets. The goose is really the traditional Christmas dish, though less a favorite with us than with many others. But a fat young goose, well cooked, which means long and moderately roasted in a covered pan, with rather high seasoning and frequent basting, is, indeed, a royal dish. A fine, large spare rib is no bad substitute, and the firm, white meat quite comparable to turkey. Chicken pie in addition makes the dinner a feast. Rather tart apple-sauce goes with either of these substitutes for turkey, and for vegetables, onions and winter squash and white potato balls are among the very best.

Try the celery in cooked form for a change. Cut in inch lengths and simmer until tender in just enough water to cover. Make a rather thick, white sauce with the water in which it was cooked and an equal portion of milk, thickening with flour and butter rubbed together, and season with salt and pepper and a mite of onion if one chooses. Arrange the celery in layers in a baking dish, covering each layer with sauce, and on the top a layer of crumbs and grated cheese. Dot with butter and brown lightly in a hot oven.

In a rich dinner a salad to follow the heartiest course helps digestion and prepares one to enjoy the pies and puddings or whatever sweets may follow. Celery with tart apples, both cut in dice is a good popular combination, or sour oranges with a French dressing on lettuce leaves. Seeded white grapes may be added. Little balls of cream cheese, mixed with chopped parsley, suit both the eye and the palate and make an excellent accessory. Rings of red and green pepper have also merit both decorative and alimentary. It is best to have the salad prettily arranged on individual plates for easiest serving.

The rich mince pie or plum pudding, both traditional features of the old-time Christmas celebration, are often omitted now, and more easily digestible compounds take their places. Either the golden yellow pie of rich winter squash, or the vivid red of the cranberry, first stewed to a rich, solid pulp with sugar, and latticed with bars of flaky pastry, will be timely and attractive.

Plum pudding ice cream is a modern novelty, eminently suitable for the Christmas dinner. For this cream soak a cup of mixed raisins, currants and shredded orange peel in a very little hot water and stir in a teaspoonful of mixed spices, cinnamon, cloves and allspice. Add this to a large cup of milk and one of cream and scald in a double boiler with a small cup of sugar and one well-beaten egg. Flavor with vanilla or orange and freeze. Any plain ice cream in a brick-shaped mold decorated with holly—two or three sprigs standing upright and others laid round the base—is one of the prettiest and most generally acceptable finishing touches for the dinner. Ice cream is really an excellent, wholesome food, one that is generally safe for the weakest digestion and all children consider it a treat. It is, therefore, to be commended for the home table, and in some of its forms it is a dessert easily made in winter, even without a freezer.

Where a tree is to be dressed the

best effect for the labor is had by deciding first of all upon a color. It may be all red and green, or white and green, green and silver or gold—any of these make a beautiful tree, and it can be easily managed by the use of plenty of paper to correspond and ribbon or cords for tying up all parcels. Glass icicles are found in the shops, and silver tinsel to be used with cotton batting to counterfeit snow effects. Balls, dangles and trifling ornaments are quickly made to suit, and any quantity of small baskets and paper candy-holders, so much the better for being home-made. Very small dolls, a dozen or more upon the tree, dressed in crepe paper or in gauzy white materials add greatly to the festive appearance and will be eagerly accepted by little visitors. After all it is the little ways of making cheer that count for most.—Country Gentleman.

THE CHRISTMAS DINNER TABLE.

A simple arrangement for the table is gained by using a thick holly wreath tied on two sides with broad red ribbons and placing in the center a crystal candelabra filled with tall candles.

Another plan is to have a centerpiece of wedge-shaped boxes holding slices of rich fruit cake or Christmas bonbons, with the points of the boxes holding rosebuds with candles. These boxes may serve as souvenirs. A vase of holly or mistletoe is placed in the center of the table. Little candles in star holders can be arranged about the outer edge of the boxes, which are tied with red and green ribbons. The place cards suitable for the season are laid on each plate, while in the napkins are placed crisp bread rolls.

For a family dinner, a glass punch bowl filled with polished fruit, may be used for the center of the table, making a mass of rich and glowing color. A wreath of grapes and holly may be placed about it and silver candlesticks can hold the tall red candles, which may have red shades, if one desires. The place cards represent poinsettias. On the napkins are placed Swedish soup crisps, rolled into cornucopia shape. Use the finest damask cloth and the best china and glass.

A star of brown and green pine cones makes another effective centerpiece, each point ending in a fan made of green pine needles. At each intersection may be arranged a small r electric light bulb, the light being supplied by a battery hidden beneath the poinsettia that is arranged in the center. At each cover is placed a sprig of holly. Bonbons and menu carry out the Christmas colors as far as practicable.—Woman's Home Companion for December.

A CHRISTMAS BLOTTER.

"With two large sheets of blotting paper of contrasting colors and an ordinary little calendar pad may be made an extremely useful gift," says Woman's Home Companion for December. "Out of the large blotters cut twelve small ones of uniform size, about ten by four inches. Paste a 'month' from the calendar, one on each small blotter, and with the colors alternating. Keep the twelve together by tying ribbon around them, with a pretty bow on top. Each month a fresh blotter may be slipped from under the ribbon and the month's calendar is right at hand. Red and green blotters tied with red ribbon are a Christmas combination."

POLYTECHNIC BUSINESS COLLEGE
306 Twelfth Street
OAKLAND : : : : : CALIFORNIA

COME TO OAKLAND
For a Business Education

Polytechnic Business College

Offers the most thorough and complete courses ever devised for young men and women who wish to prepare for the highest and best paying positions.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

PAGE FENCE "JUBILEE YEAR."

It's a pretty good record when a fence "stands up" for 25 years, and that is the record made by the Page Woven Wire Fence Company. When the United States Government asks for bids on wire fences the specifications say that all bidders must figure on "Page Fence or equal."

It is in use by over 800,000 farmers, stock and poultry raisers, dairymen and fruit growers, a pretty solid endorsement. One good point in the Page Fence is its entire lack of welded wires and short strands, the stay wire being one continuous piece, firmly secured top and bottom, and wrapped three times around every horizontal. This prevents the sliding up and down which invites stock to enlarge the opening. These horizontal wires are coiled lengthwise and are so elastic that when stock stampedes into it it will spring right back into place when the weight is released.

"Jubilee Edition" catalogue is just issued which will be sent free if you mail a postal card to the Page Woven Wire Fence Co., Adrian, Mich.

San Francisco Markets

SAN FRANCISCO, Dec. 15, 1908.

Hay.

Somers & Co. say:

There is no general apprehension at the present time concerning the outcome for with concessions in freight rates which can be granted under emergency measures, considerable quantities of hay can be brought here from the surrounding states. It is our idea that the market will be maintained at but little above the present range until possibly at the very end of the season, at which time we may have a short period of extreme prices. The rather moderate demand on the San Francisco market should prevent any great excitement or great advance over present quotations.

Today the market holds at about the same range as was noted a week ago; on some days with light receipts sales are effected at above quotations but any day with an over-supply brings a reaction again. With the loss of our Government export trade because of high prices it is found that our market can absorb but moderate quantities of hay with ease.

QUERIES AND REPLIES.

Continued from page 595.

large quantity and knowledge of how to get best results would be valuable indeed.—Inquirer, San Diego.

Poultry manure is good for almost any garden crop, but especially beneficial upon all vegetables that are wanted crisp and succulent. Care must be observed that the applications are not too heavy at any one time, as it is a highly concentrated manure, and an overdose will work injury to the crop. —Q. A. L.

Some compost with an equal quantity of cow manure, using plenty of land plaster to prevent loss of nitrogen. If applied direct to soil it is well to spade into soil well, thoroughly mixing before planting seed.

Bone Cutter.

Please tell me of a bone cutter which a woman may manage.—Mrs. L. R., Fair Oaks.

Cutting green bone is a hard proposition at best and the only one which a lady will enjoy running will be one run with a gas engine. There are many good ones handled by the poultry-supply houses advertising in the Cultivator, but all will take fairly good muscle.

Planting Vineyard.

I am preparing to reset an 80 acre vineyard 40 to muscats, 8 each to Thompson Seedless, Red Emperors, Cornichons, Tokays, and Black Moroccos. I wish to ask if rooted vines of the last five varieties named can be gotten in your section, and at what price? Is it safe to ship them from the San Joaquin Valley?—A. H. C., Covina.

I would buy my vines as near home as possible, and see that the quality of these was high before purchasing them. I would not trust to any one else for so large a setting of vines. I would know for myself that they were good before putting them into the ground; $1.50 is cheap for cuttings if they are all made from the butts of the vines. I would rather pay a price that would allow me to put a careful man into the vineyard to follow the pruners and make the cuttings from the fresh wood, making the cuttings as fast as they are pruned and heeling them in every night. These we know will then be as good as we can possibly make them. When it comes to vine-growing there is so much that we do not know positively that it is well to put into practice all that we do know.—M. E. S.

Burr Clover for Green Manuring.

I note that you recommend burr clover for cover crop. Where can I secure seed? How many pounds should I sow to the acre?—H. B. B., Hanford.

We put the seed in with a single drill in one row between each row of grapevines and trust it to spread itself afterward by its seeds. If I remember rightly, we tried to sow sixty pounds to the acre, but found we had actually sown as high as eighty. It did not prove too much, however. After a piece is once sown to burr clover, it will come up every year if you hold back the plowing a little. The first expense is therefore the only one. If you are not in a great hurry to have it to plow under, sowing every other row will soon give you enough to cover the ground. All cover crops mean later plowing and pushing the work with more horses. We try to hold off as late as possible to let the burr clover form at least a few seeds for next year. We have several pounds, about twenty, of Tangier peas sown for seed this year. These are inoculated and are being planted as an experiment for the United States government. They are said to grow faster than the common field peas, and mature earlier; if this proves to be the case, they may prove to be the nitrogen-producer we are seeking for the vineyards.—M. E. S.

Bitter Cream.

After the cream from the milk of our cow stands twenty-four hours, it becomes very bitter. We are feeding alfalfa, bran and pumpkins.—N. R. B., Riverside.

The cause of bitter cream is not often a fault of the cow or of the feed she is eating. It often comes from a bacterial growth in the milk that develops at a temperature too low for the lactic acid bacteria to increase. The milk or cream turns bitter instead of souring. The remedy is first to scald everything used around the milk to get rid of the spores of these bacteria. The coldness will preserve it from all changes, while the increasing of the temperature to sixty or sixty-five degrees will cause it to sour naturally. Thanks for your kind appreciation of my little efforts to be helpful to others.—M. E. S.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Please address all questions that are to receive gratuitous replies through these columns to California Cultivator, 115½ N. Broadway.

All communications to Dr. Whittlesey direct should contain a great big dollar.

Tumors.

I have a gray mare with bunches around her jaw and head from ear to ear which cause her to breathe hard when driven. Claimed to be coloring substance and gathered in the glands when she changed from black to gray; also one large bunch back of left shoulder low down. None of the bunches are sore but are hard. She eats hearty and keeps in good condition. Can the bunches be taken off with safety to the animal?—W. H. C. Holtville.

They are melaninotic tumors caused by the coloring matter not used up in light gray or white horses.

There is no need in removing them unless they interfere with some function and in those cases might be a difficult operation. I think in your case it would be a difficult and dangerous operation except for an expert surgeon.

A Good Liniment.

I have a colt seven months old which I think took cold about two weeks ago. There was a little discharge at the nose at first. The colt seems to be all right except it has a loose cough; squeezing it a little by the throat causes it to cough. It is all right other ways. Please let me know of some remedy.—C. P., Campbell.

Have the following liniment made and rub on the colt's throat. Ammonia, turpentine, cottonseed oil—equal parts, shake well before using.

Horse Running at the Nose.

What would you advise in the case of a horse running at the nose? I have an old horse which from time to time will run more or less whenever he catches a little cold. When working, it gradually decreases.—H. A. G., Morgan Hill.

Any horse running at the nose is dangerous. It may be glanders or only a simple discharge at the nose, but it is dangerous for you to take any chances. If I am not mistaken, you are in Santa Clara county, and I would advise you to call on your county veterinarian, Dr. Browning, in San José, and have horse tested with malline.

DESCRIPTION OF PLANTS AND SEEDS.

It requires a 132 page booklet, and large pages at that, to describe and illustrate the seeds, bulbs and plants handled by the C. C. Morse Company of 125-127 Market Street, San Francisco. The Morse Company is one of the biggest seed growers and handlers on the Pacific Coast, and this catalogue fully represents their business. The illustrations alone are an education as to the method of handling seeds in the Santa Clara valley where most of the Morse seeds are grown on their seed farm. The seed and plant descriptions are also instructive. This catalogue will be sent for the asking.

SEED CATALOGUE.

Another magnificent catalogue has been issued by the Aggeler & Musser Seed Company, successors to Johnson & Musser Seed Company of 113-115 North Main Street, Los Angeles. This concern has recently more than doubled its store room space and this catalogue is in keeping with the increased business facilities. Nearly every seed grown in California is catalogued here and a vast fund of information may be had by its perusal.

DECIDUOUS FRUITS.

While not exclusively a deciduous fruit catalogue, the one recently issued by the Marshall Nurseries of Fresno gives most extensive descriptions and in many cases illustrations of deciduous fruit trees. This nursery is situated in the center of the great deciduous belt of the San Joaquin Valley, so these trees are given the greater part of the descriptive matter. However it must be mentioned that eucalypts, of which this firm is growing nearly a half million, are prominent, and roses, ornamentals and other factors are all featured in this book. The catalogue will be sent free on application.

The attention of our readers is called to the Security Ladder made in Riverside by Mr. E. A. Meacham. Mr. Meacham is himself a prominent orange grower and has recently solved a vexatious problem in providing a "ladder that is worth buying," as he quotes his customers. These ladders have made an enviable reputation in the year he has been manufacturing them and he is evidently intending to capture the trade in this important line by reducing his prices to the lowest limit as announced in the columns of the Cultivator.

New Pomona Double Plunger Deep Well Pump Head

Most Efficient Deep Well Pump in the State

It Is Made in California

Built in Three Sizes—from Ten to Forty Horse Power

It is the smoothest running deep well pump because there are no dead centers, no jerk or jar, and no danger of breaking the pump rods. Be sure and write for our big catalogue. Watch this space for further information.

Pomona Manufacturing Co.
Pomona, Cal.

THE Latest Deep Well

Guaranteed to deliver from 100 gallons per minute upwards, depending on the diameter and capacity of well, from a depth of 50 to 300 feet below the surface. Can be either belt driven or direct connected to electric motor as occasion requires.

Write for Catalogue 46B.

Byron Jackson Iron Works

Turbine Pump

A deep well pump that has no valves or plungers to wear or get out of order, no gears, consequently no noise or breaking of teeth.

Compact, durable, always primed and ready to operate, constant flow, hence increased capacity of well.

This type of pump is fast taking the place of Vertical Steam, Deep well Plunger and Propeller Pumps.

The Evaporation of Apples

An Address Delivered Before the State Fruit Growers' Convention at Sacramento

By W. I. NEWCOMB, of Sebastopol, California

THE disposition of fruit not suitable for green shipment or for canning purposes has been, and always will be, more or less of a problem for the fruit grower. In these days when the market calls more and more for better quality, the apple grower finds, after his best packing fruit is sold, still much fruit on his hands to dispose of, wind falls, that bruised in packing, also small sizes. This cull fruit is largely dependent upon the thoroughness of the spraying methods employed, the season, and the pruning and thinning work done.

While evaporated apples today are a by-product of our orchards, a glimpse at the early history of the business in Sonoma county shows that it was to provide for a market for the product of the orchards that were put out by the first settlers. The early pioneers were quick to recognize in the cool, coast summers a suitable climate for the apple. Every home had its three or four acres, and some as many as thirty, planted with a multitude of varieties. The fruit of these young orchards, which yielded so abundantly, was often allowed to go to waste, for lack of proper market facilities.

In 1874 the late W. J. Hunt bought an Alden evaporator that was shipped out from New York. This was an expensive, cumbersome machine to operate, the fruit being elevated the entire height by chain pulleys on the side. Owing to the cost of operation, Mr. Hunt did not run it again until 1876, when he made another attempt, putting up the fruit in two-pound cartons. The press to pack these packages cost $130. Although the fruit sold for 25 cents per pound, the venture still did not show a profit, and the machine was never used again. However, the price obtained for the fruit was an incentive for further effort by Mr. Hunt and others. By 1879 and 1880 Santa Rosa had two, and Petaluma, Bloomfield and Sebastopol each had one large dryer, where the farmers sold their apples by the ton, hauling them in some instances ten or twelve miles. But these long hauls of fruit, which, when ready for market were only about one-seventh of the weight delivered, soon opened the eyes of the apple men to the advantages of operating on a smaller scale at home. By 1885, a number of dryers, as they are called, were built throughout the apple section, and today we have 100 or more scattered about the coast hills of Western Sonoma.

The Chinamen were quick to "catch on" to this kind of work. Their habits of rigid economy and thrift soon put the evaporated apple output in their hands, usually working the fruit on a share basis. But the Chinaman's thrift and economy often prompted him to apply too much moisture to his apples to make them "pack easy." His horror of waste kept him from "trimming" as he should have done, and he was apt to put in inferior fruit, consequently "China apples" became a trade term. Now, the Chinamen are getting old and not much account. The Japanese and Hindus have not taken up this kind of work to any great extent. Our own young people, however, are becoming very proficient in the art, together with the packing of the green fruit, the two operations going hand in hand. This pleasant occupation furnishes employment for many for four or five months in the summer and fall, and is helping us to solve some of the problems of "Our Country Life."

The dryers we have about the country are cheaply constructed as far as the building is concerned on account of fire liability. Scarcely a season passes without two or three of these buildings going up in smoke, consequently few insurance companies care to handle this class of risks, what do charge from 5 to 7 per cent.

Our dryers are nearly all built on the same plan, the upright two trays wide, and from 12 to 15 trays high, being the style settled on as being the cheapest and most easily operated. The size of the tray is a personal preference. Usually sloping ground is preferred for a site, in order to get the fire box or furnace low down, to prevent the scorching of fruit. The upper side will then be more convenient for unloading the green fruit from the orchard truck or wagon. The furnace is enclosed within brick walls on which the evaporator is set. These walls should be high enough to give from 4 to 7 feet of air space between the top of the furnace and the bottom tray. Connected with the furnace is a double run of pipes, making a double turn the length of the evaporator. These are to prevent loss of heat. Usually a large drum is connected with the pipes at the back to further hold the heat. The evaporator is made of matched lumber, constructed in "runs" the size of the trays. A ventilator projects from the evaporator through the roof of the building to carry away the moisture in the air. This hot air draft is furnished with cold air ventilators, through openings in the brick walls, about a foot square at the ground level. It is more convenient to have the sides of the evaporator all doors for convenience in putting in and taking out the fruit. On one side of the evaporator is a room for receiving the dried fruit, on the other a larger one for receiving the apples, peeling and placing them on the trays. This work is usually done by a man or stout boy to run the peeler, and one or two girls or women to "trim" and "spread" the fruit on the trays. After the apples are placed on the tray they are put in the sulphur box and exposed to the fumes of burning sulphur to preserve the natural color of the apple. This exposure requires from 20 to 40 minutes, according to the variety of apple, the earlier and more open grained apple requiring less, while the hard, late apple takes more time.

When Ruling No. 76 of the Pure Food Law was announced last year, the apple men came in for their share of consternation, but tests soon proved that apples contained less than one-half of the sulphur dioxide allowed under the ruling. As taken from the sulphur box it contains two or three times the amount allowed, but from 75 to 90 per cent passes off in the process of evaporation. From the sulphur box the trays are placed in the evaporator and heat applied. It is possible to fill and get dry the capacity of the dryer each day by some firing a part of the night. After the fruit is dry it is taken out and the trays emptied in the packing room, where it is packed as sold or removed for safety.

About 100 pounds per day for each person employed is an average day's work. One crew of seven this fall put out 1060 pounds in 10 hours, two "peelers," four "spreaders," and one dryer tender. From one and one-half to four cords of four-foot pine wood is required to evaporate one ton of dried fruit, and from five to eight pounds of sulphur. Two and one-half cents is about the average cost of drying and packing in fifty-pound boxes, which is the standard package, although some markets, Germany for instance, prefer the twenty-five-pound box. Some ten, five and one-pound boxes are put out. It would seem that retail trade would be stimulated by small packages of more attractive fruit.

The buyers continually deplore the quality of our fruit, and suggest government inspection aas a remedy. This might be accomplished under the Pure Food Law. The shrinkage is generally estimated at about seven to one, early varieties shrinking more, and the late, less. By actual weight 100 pounds of windfall Baldwins gave 16 pounds of dried fruit, the shrinkage being 6¼ to 1. A quite large percentage of waste in the peels and cores can be utilized by sun-drying, there being a small market for this product at the jelly factories, prices ranging from $15 to $25 per ton. But a better way is to feed it directly to hogs, as the seeds are quite nutritious and make a very good stock hog feed. Hogs weighing 100 pounds or more thrive better on this diet. Hard grain cannot be fed with the peelings as the hogs get tender teeth.

This year Sonoma county will turn out about four million pounds, Watsonville district two and one-half million pounds, Mendocino and other districts enough to make eight million pounds.

Germany takes some of our apples, but the most are consumed in our own country. Alaska takes a part, as do the Rocky Mountains and Middle West points. Texas, too, is a large buyer, as is also Uncle Sam for his Army and Navy and Indian Reservations. New York state, being the largest producer of evaporated apples, largely controls the market price.

Apples are quoted Fancy, Choice, Standard and Prime, with a variation of two to three cents per pound on the extremes. It is claimed that our Choice sell on a par with the New York Standards. As our output is rapidly increasing, we will have to look more to tthe quality of our fruit. Some day the American people will awake to the fact that the best returns are not always obtained by the maximum of production.

The International Institute of Agriculture, established under the patronage and through the efforts of the King of Italy in 1905, will be practically organized in the winter of 1908-9. This institute is sustained by 46 countries.

Among the purposes of this institute are the collection, study and publication of statistical, technical and economic information concerning farming, both vegetable and animal products, the commerce in such products and the prices prevailing in the various markets; the ascertainment of the wages paid for farm labor; the publication of information concerning new diseases of vegetables which may appear in any part of the world; the publication of information concerning agricultural cooperation, insurance and credit; and the submission to the adhering governments of measures for the protection of the common interests of farmers and for the improvement of their condition.

PERSIMMONS.

THE market for persimmons is quite limited and, in my judgment will never be otherwise. This is not my opinion formed from personal tastes, for it is a favorite fruit of mine and if everybody consumed the same proportion of them that I do when I can get them, the demand would not be supplied for many years. But the fact remains that persimmons have been eaten for generations in this country and still the demand does not increase to any appreciable extent.

This is due to the character of the fruit. It lacks the refreshing acids that are found in nearly all fruits. It is true that many new and improved varieties have been introduced but they are persimmons just the same, and they cloy most persons after eating one or two.

Nearly every person can eat several peaches, apples, oranges etc., in a day and still retain an appetite for them. Not so with the persimmon. This is the prime factor that will always insure a light demand for the fruit. Horticulturists who imagine that there is going to be a greatly increased demand for the fruit will no doubt be greatly disappointed if they plant with that idea.

Every family orchard should have one or two persimmon trees in it for it is a delicious fruit for some member of the family, as a usual thing. There are many varieties, all of which are good but for a small family orchard a good selection of two varieties would be Hyakume and Goshio. The former is an early variety with little or no astringency and can be eaten while still firm. The flesh is brown aud crisp. Goshio is a later variety that is not good to eat until it softens up in the good old persimmon way.—J. W. Mills.

ORANGE CONDITIONS IN FLORIDA

THE need of co-operation and of greater care in marketing all fruits is shown by Florida conditions in oranges as presented in the following from the Florida Fruit and Produce News:

Pretty tough. Isn't it? Could it be worse? Look at the sale in New York of a carload of Chapman's Old Mission Brand of California Valencias. Fancy, $8.75 to $9.50 per box. Choice, $7.60 per box; Standard, $5.75 per box.

There you are. Fancy Florida hard to sell anywhere at $2.50 per box. Choice, $1.50. What's the reason? Whose fault is it? Is our fruit as good? Is it handled as carefully?

Keep going on like you are going, Mr. Orange Grower, and both you and us will have to look up a job somewhere.

There is a remedy to prevent the present miserable conditions. It is not necessary that oranges should be rushed out of this state all at the same time. The orauges in the northeru part of the state mature and color up earlier than those in the southern part.

If all sectious were organized and represented at a geueral meeting, it could be decided which sections should ship first aud the crop could be moved systematically instead of every man rushing his fruit to market, helter-skelter, to get any old price that can be obtained.

The law of supply and demand regulates the price, just as sure as the good Lord made little apples, and as long as men are chumps enough to think they can beat it, just so long will they have their present conditions to contend and put up with.

It is beyond our comprehension why men will work, deprive themselves of many of the necessities of life, to make a crop, and then use it to keep his neighbor from getting a living out of his crop. Of course he don't mean to do this, and don't think he is doing it, but that is just what he is doing. The whole bunch is individually competing with each other, ruining the markets and depressing prices, while a systematic method of marketing would stop it all, and result in hundreds of thousands of dollars being saved to the growers. But don't do it, just go along as you are doing and you will be broke. Then who will sympathize with you? Who should? Do you deserve sympathy? You will just get the grand laugh. Business men adopt business principles and stick to them, else they would not succeed. If business principles were adopted and followed by the growers they, too, would succeed.

COSTLY LESSONS.

The shipping of green fruit has resulted this year in more serious losses than usual. The fruit has been pushed so as to secure the big prices and pushed forward in such a condition that it has disappointed purchasers. This should not be. The only excuse usually offered is that "some one will do it if I don't."

The ambition to be the first should be a mark of disgrace instead of a credit. Because that first shipment, when made in October or during the first of November as is usually done, can only take money out of some other grower's pocket, because such fruit being unfit for food for humans, injures the market for weeks to come.

Florida is making a strenuous fight to stop the evil and this year's results in California will probably convince many growers that something must be done here. Most of the southern part of the state has learned the lesson and profits by it.

The Exeter Sun in an issue of sometime since said:

Already serious loss stares several of the growers, in fact many of them, in the face because of sending the fruit out in a grass colored condition, or as one fruit jobber in Buffalo, N. Y., wrote to W. O. Randolph, "The oranges we are getting from California at present are 'Irish Granges' and it is too early for St. Patrick's Day."

Mr. Randolph, continuing further anent the subject, said: "For some reason the color did not come as early as usual and they failed to color during the journey to the eastern market."

Mr. R. D. Williams, the well known orange grower just east of Exeter, returned from an extended trip through the north and northeast last Friday. He first went to Butte, Montana, then to Seattle and from there to Portland and at each of these places and several smaller ones he investigated the orange coudition.

He found almost everywhere plenty of California oranges and of this year's crop, but very few selling. In fact, at Butte there was a great de-

mand for Valencias of the past summer at 60 cents per dozen but scarcely a person would take a navel of this year's crop because of the green and poor condition of them.

In Seattle and Portland the same condition of affairs prevailed, there being absolutely no market for the crop and all of them being stored in the sweat houses. Some of these he looked at and found them to be getting soft and mushy.

The editor of the Lindsay Gazette has the following to say:

The writer dropped into one of the packing houses last Saturday, Nov. 21, and we were told that they were then packing the first fruit that was ripe enough to send to the eastern market. It may require some hard knocks before growers learn that the best policy is to ship riper fruit but he must come to it sooner or later. One grower said the other day that he would sign an agreement to not pick his fruit before Nov. 10th if others would do the same.

In conversation with several growers the past week the Sun has been informed that nearly everyone of them is willing to wait until the fruit is riper, but that just so long as one man ships the others will.

There should be a meeting of the growers next year and arrangements made whereby only a few cars of fruit are to go out and the big receipts from them, if there are any, be divided amongst the growers in total.

It is ruining the good reputation of the country to ship such fruit, and unless it is stopped, will ruin the growers.

YELLOW SPOTTING OF CITRUS LEAVES.

During this summer and fall specimens of citrus leaves affected by a greasy yellow spotting have been received at the experiment station from several localities in the citrus region. This disorder has been noticed in a few places in previous years, but it has evidently been more prevalent during the present season. Some of the places from which it has been reported are Tropic, DeLand, Winterhaven, Eustis and Clearwater. Several affected groves have been carefully studied. In one orange grove nearly every tree was affected, and in some trees a healthy leaf was hard to find. In another grove which was shedded and contained both oranges and grapefruit, from 50 to 75 per cent of all the trees were more or less attacked. It was equally bad on hammock and high pine land. No relation to any particular brand of fertilizer was noticed.

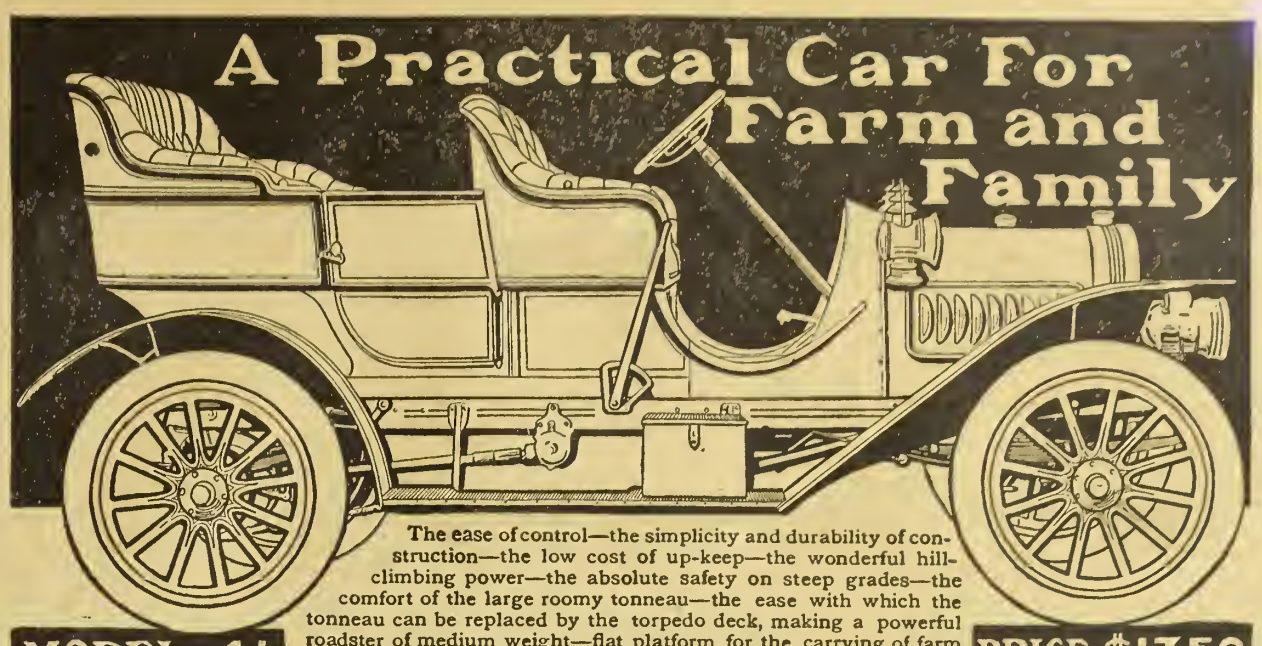
Varieties Affected.

Grapefruit appears to be more frequently and severely affected than oranges, although the disorder seems not to be confined to any particular variety of citrus. Among oranges, the King and Enterprise Seedless were found to be very susceptible.

Description.

The symptoms of this malady seem to be confined to the leaves; although a spotting was noticed on some fruits from a grove near Eustis that very much resembled the spots on the leaves. The appearances on the leaves are yellowish to golden-colored spots, a fraction of an inch or more in diameter. They usually occur between the main veins and extend through the substance of the leaf. The spots differ in appearance on the upper and under surfaces of the leaf. On the upper surface, the yellowish or golden color is more noticeable, and the central portion of the colored area is often darker in color than the margin. The spot is usually not raised above the upper surface of the leaf. Occasionally dark-colored elevations, from the size of a pinhead upwards, may appear within the yellow. On the under surface the spot nearly always projects beyond the surrounding surface of the leaf, and usually has a dull, greasy look, and a yellowish-brown or olive-green color. The surface of old spots may become rough and dark-colored. Cross sections of the leaf, seen under the miscroscope, show a swelling of the cells in the spongy part of the leaf next the lower surface, with scattered brownish deposits. In some cases, the cells adjoining the upper surface may also be affected.

A definite cause of this disease is not known. It is perhaps a physiological trouble. At times it is associated with die-back, of which it may perhaps be a form. The microscopical structure of the diseased tissue is similar to that of the die-back. We cannot as yet recommend any treatment for this trouble. One grower reports having obtained favorable results by applying lime and mulching. —Florida Experiment Station Bulletin.



MODEL 41 PRICE $1350

The ease of control—the simplicity and durability of construction—the low cost of up-keep—the wonderful hill-climbing power—the absolute safety on steep grades—the comfort of the large roomy tonneau—the ease with which the tonneau can be replaced by the torpedo deck, making a powerful roadster of medium weight—flat platform for the carrying of farm implements, farm produce, baggage, etc. These are but a few of the special features that make the

Rambler
THE CAR OF STEADY SERVICE

A Practical Car for Farm and Family Use

It is built to meet every condition demanded of the automobile on the farm. It is built in the largest automobile factory in the world, where nothing but the very best of tested materials are used—where none but the highest skilled labor is employed to operate the finest machinery that human brains can devise; all under the personal supervision of a man with whose name the word Rambler has been identified for 29 years. It is this close, personal attention to the details of construction that is your safeguard—your guarantee that the Rambler will stand up to its work and never disappoint.

The large wheels, the big tires, the perfect springs, and soft, elastic cushions, make all roads good roads. You can take your family for long rides after the day's work is done and come back refreshed and happy. Change the touring car into a luxurious two-passenger roadster that the younger folks will enjoy—a car that will make them contented and more willing to stay on the farm. The Rambler is so simple in construction that it does not require a mechanic to take care of it. Over 90% of Rambler owners drive and take care of their own cars.

You can learn to run a Rambler in an afternoon, and you will find it as easy to manage as the gentlest horse on your place.

When we ask you to pay $1,350 for a Rambler we are offering you the best car that can possibly be built for that money. Let us send you our *Farm Folder* No. 156. It's free and will give you much useful automobile information. It will give you the names and addresses of many farmers who are owners of Ramblers—why they choose that car—what they do with their cars and what it costs to maintain them. Don't fail to write for this Farm Folder.

Save Time—With the Brewster Picking Sack—Save Fruit

A new method sack—invented and perfected by lifelong growers. Eminent orchardists pronounce it perfect. Those who have tried it say they would not be without it. Actual tests show that a man can pick twenty-five per cent more fruit with it and with greater ease.

Sack forms semi-circle about picker's body—is supported by straps over both shoulders and held tight by belt around body. The picker can thus work with ease either on ground or ladder. When full, it does not extend below the hips.

A great feature of the Brewster Sack is the patent gate (see illustration) WHICH PRACTICALLY ELIMINATES BRUISING. Simply unfasten a hook—the gate drops—and the fruit can be quickly but very gently poured out.

The sack holds as much fruit as the old style sack.

Made in two grades.

Regular picking sack grade, sent express prepaid for $1.50.

Special extra quality—that will outlast two ordinary picking sacks—express prepaid $1.75.

Sierra Madre Sack Co., Sierra Madre, Cal.

We want reliable men in every locality to demonstrate this sack and act as our agents.

Deciduous Fruit Culture

By J. W. Mills

CRUDE OIL EMULSION FOR WINTER SPRAYS.

In a talk on sprays and the winter use of them by Dudley Moulton, of Campbell, the entomologist in charge of California deciduous fruit insect investigation, Bureau of Entomology, Department of Agriculture, Mr. Moulton said as reported by the San Jose Mercury:

"Numerous inquiries have recently been made regarding the spraying of fruit trees here in the Santa Clara valley for the Italian Pear scale, the Brown Apricot and the Black scales, and the lichens which gather on the larger lower limbs. Since it is just now time that this spraying be done, the following notes and formulas are presented. Orchardists have been variously advised to use the Caustic Soda, or the Caustic Soda and the distillate oil in mechanical mixture, the Lime-Sulphur 'Rex' and other lime-sulphur solutions, and the crude oil emulsions. All of these sprays are good but the orchardist is at a loss to know just which spray will be most economical and at the same time give the best results.

Caustic Objectionable.

"The caustic soda is an effective spray for lichens but it is not at all desirable for the Italian Pear Scale. Caustic soda and distillate oil would be much better but this mixture must be applied with a power sprayer. The caustic soda is efficient only as the spray is caustic and to be effective the scales and lichens must be killed immediately after the spray is applied. This wash too has the tendency to burn and shrink the bark which afterward becomes very brittle, and it would not seem desirable to use it on the same trees more than once. The lime-sulphur 'Rex' solution and the other lime-sulphur solutions which are not prepared at home are found to be far inferior when compared side by side with the home-made mixture. They do not kill all the lichens neither do they kill all of the scales when they are applied at the strengths which are recommended by the manufacturers. The home-made lime-sulphur wash is to be preferred when a sulphur wash is desired.

Crude Oil Better.

A crude oil emulsion, made with a soap and any one of the heavy California crude petroleum oils has given by far the best results. The spray is not caustic and is not immediate in its action. It rather covers the barks with a thin vaseline or oily coating which spreads and penetrates for several weeks. It seems to loosen and kill the lichens so that they drop away after the rains and the spray continues to penetrate underneath the encrusted scales, until finally all are killed. None of the other sprays is so thorough in its work of cleaning the trees of all of the above mentioned scales and the lichens and no one of them can be prepared so cheaply. The emulsion will cost about one-half cent per gallon ready to apply to the tree, the other sprays will cost from one to two cents per gallon or more.

Some Others.

"Several local proprietary soaps can be used to make up a crude-oil emulsion but they are rather expensive. Whale-oil soap, or a home-made fish-oil soap serves the purpose just as well. Whale-oil soap costs about 3 cents per pound, while the fish-oil soap can be prepared at home for about one and one-half cents per pound. Other formulas for soaps which may include rosin, kerosene, or crude carbolic acid are often recommended, but these are more expensive and they do not emulsify our crude oils any better, and apparently not so well as the simple, home-made fish-oil soap. The following soap formula has been obtained from the manufacturers of Babbitt's lye and is entirely satisfactory. Place six gallons of water in a boiler or caldron and then add two pounds of lye. Boil the lye until it is all dissolved. Then add one gallon of fish-oil and boil slowly for about two hours or longer. Let it boil slowly so that it will not boil over. This should make about 40 pounds of soap or about a five-gallon can full.

Formula.

"The crude-oil emulsion is made after the following formula:

5 lbs. of whale-oil or home-made fish-oil soap.
1 lb. lye.
43 gallons water, preferably warm water.
5 or 6 gallons crude oil.
To make 50 gallons of emulsion.

"Dissolve the soap in five or ten gallons of warm water and later place this in the spray-tank or barrel and add water to make the full 43 gallons. To this add one pound of caustic soda or lye. After the soap and lye are dissolved pour the crude-oil in slowly and stir thoroughly while this is going in. The emulsion is then ready to be sprayed onto the trees. The secret of making a good crude-oil emulsion is to be sure that the soap and the lye are thoroughly dissolved in the full amount of water before any crude-oil is added for if any water is added to the mixture after the oil is in, free oil will begin to gather on the top immediately. The emulsion should be stirred constantly while it is being sprayed onto the trees. This crude-oil spray is also recommended as a winter spray for the Red Spider. It can be applied on any of our deciduous trees as a winter spray without fear of injury until the blossom cluster buds begin to unfold."

The last rabbit drive in the Antelope Valley gave a net results of 4000 bunnies killed.

Six of the Most Valuable New Fruits

Ever Introduced in California

"Improved French" Prune
Originated by Luther Burbank

"Concord" Walnut French Variety
Grafted trees only. Better than Franquette or Mayette

"Paul" Cherry Finest Black Cherry

"Philippi" Grape Handsomer than Tokay; a month earlier. Disinfected cuttings only, to comply with quarantine laws.

All these, like Muir, Lovell, and Phillips Cling Peach, are of California origin.

"Comet" Red Currant Much larger, earlier and sweeter than any other.

"May Duke" Gooseberry
Earliest of all; large; smooth skin.

GREEN MANURING CROPS.

IT is the general belief among the deciduous fruit growers of Central and Northern California that it is more bother than it is worth to grow green crops for fertilizers among the trees and vines. The cleaning up after pruning and the inconvenience at plowing time in the spring keep many from planting green manuring crops. It was not many years ago that many citrus growers of the south objected to growing these crops in their groves because of the inconvenience of taking out the fruit in the winter and spring when the green stuff was knee high and besides it mashed it down and destroyed it. It being suggested to them that they plant every other space and alternate their planting each year, they proceeded to do so. The result was that they soon dropped this method and planted everything solid. They found that it was better for the soil where fruit was hauled over it, to have a coating of green stuff. The land was not packed so hard and the green stuff that filled the spaces was no inconvenience after all. The fruit could not be picked soon after a rain unless drying winds followed. The result is, in the Riverside district alone, where a few years ago, only a few hundred acres were sown to green stuff, there are now close to ten thousand acres of citrus groves planted to green manuring crops every year. The improvement in the physical condition of the soil is so marked that it renders subsequent cultivation much more effective and cheaper, due to the more friable condition of the soil.

Remedies.

The tight and hard condition of the soil in many of the orchards and vineyards of Northern and Central California is due to the lack of humus in them. The soils have been depleted of it from constant clean cultivation. The remedy is to add humus by applying either stable manure or growing green manuring crops. Where the former is cheap and convenient, it should be used by all means. In addition to it, green crops should be grown as abundantly as possible so as to add the greatest amount of humus.

After many years trial in the southern part of the state, it was found that winter vetch was the best for green manuring as it would not get dry and stringy if allowed to stand a little after the proper time for plowing under.

Obstacles.

Growing green stuff in an orchard is not a problem except under two conditions: A dry spring which may catch the grower without means of irrigation, with a dry weedy orchard on his hands, or an exceedingly wet spring may delay plowing so late that he will have a wilderness of stuff to plow under so late that it will not have time to rot before dry weather comes on. An irrigation plant that will soak up the orchard will overcome both of these obstacles. Such an outfit will more than pay for itself in most cases for irrigation later and before the fruit is harvested. There are few seasons when irrigation would be necessary as a supplement to growing green fertilizer and the improved physical condition of the soil will render both cultivation and irrigation more effective. It has been our experience with the grape soils of Yuba county before grapes were grown, that places where wild clover and lupins grew abundantly, and even the California yellow poppy, that the soil was always friable and mellow after land adjoining would be dried out and hard. These places always raised the largest crops of grain and hay.

After some of this land was planted to orchard, the plots that had been so well supplied with humus continued to be more friable and more easily gotten into "shape" than other parts where the soil appeared the same in other respects; also, the trees while young made a better growth where the humus was present, and continue to show a difference to this day.—J. W. Mills.

Financial Conditions Facing Small Fruit Growers

Written for the Cultivator by J. W. Roe of San Gabriel, Los Angeles County.

IF I comply with your request for my opinion of the industrial situation of Southern California, you will pardon my personal allusions.

I enclose a photo which will be my text. This shows a strawberry patch, 2½ acres of which was in full bearing this season.

One acre of this ground netted me over $1100 two years ago. The whole patch did not pay expenses this year, and you ask why. My answer is Japs.

They have increased the acreage over eight times this season in this valley.

When I pay from $1.50 to $1.75 a day for help my berries cost me about 82 cents per crate to get them ready to haul to market. This includes labor, water, fertilizer, boxes and all expenses, except marketing, my time and interest on investment.

I keep an account with my berries just as your bank does with you. Every cent paid out for their maintenance is charged to them and when I sell a berry it is credited to their account. In this way I know exactly what I'm doing.

J. W. Roe's Berry Ranch.

A Jap came to my house a few days ago for some sweet potatoes. He could talk very good English. He said to me, "You raise strawberries too." "Yes," I said, "I have a few. How many have you?" "Eight acres," he replied. "Where?" I asked. "On Mr. Baldwin's ranch" he answered. "Did you make any money this year?" said I. "No, we lose money all time; no pay water, no pay rent, no pay boys for work either, no pay rent last year. 'Alright,' Mr. Baldwin say, 'maybe you pay me next year.' We pay boy $1.00 to $1.25 a day, not more."

Well, I can compete with any white man living, in my business, but I can't compete with orientals who are harbored and backed up by white men in this fashion.

I said to this Jap. "Before you Japs came into the San Gabriel valley, truck gardeners could make a living, but since you came here we have lost money. You had better move out: we don't need you."

One dozen Japs will live on what it costs me for a family of four.

They are not to be trusted—are dishonest.

A Chinaman is a white man beside a Jap. A Chinaman may produce stuff for less than a white man, but he will never cut the price. The Jap will cut under all the time.

But for the loyal support of my Pasadena customers I'd have had to turn my berries out to grass this season.

I said to them, "Boys I must have at least $1.00 per crate for my berries or I can't bring them to you." And three of them did take my entire crop. The lowest they paid me was $1.00 per crate and at this time they were buying Jap berries for 60 cents per crate that were just as good as mine.

You can rest assured that I fully appreciated this. They argued that it would be to their advantage to help me keep my berries, for as they said, "Roe will be in the garden business when these Japs are sent home."

As I told our Congressman McLachlan, "I don't mind paying big wages to white men who spend their money here, but I do hate to see the yellow coin of the realm running in a continual stream to Japan." Nor is the berry grower alone. There were thousands of acres of potatoes raised in the San Gabriel Valley by Japs and sold at 60 cents per hundred this year. A white man can't produce them for that amount of money.

The Japs are renting orchards and soon apples, peaches, and apricots will fall under the ban. I believe I am safe in saying that fully 65 per cent of the farm products of California are produced by Japs.

You as an American can't rent, buy or borrow, beg or steal a piece of land in Japan to raise anything on. Give them the same treatment here and they will soon leave the country.

They are a great damage to California. The thousands of tourists who come here every winter find out these conditions before they go back and when they get home their friends ask them about the industrial situation in California and they simply tell them the truth. Intelligent white labor won't rush to California to compete with Japs. They never will come, in my opinion, until they are protected by laws prohibiting Japs from owning or operating real estate in this country.

The Japs are doing to the market gardener of California just what free trade in citrus fruits would do to the orange and lemon growers here, driving them out of business. Is this to be a white man's country or not? Ask your congressmen.—J. W. Roe.

The Board of Supervisors of Yuba county is somewhat at logger-heads with the State Horticultural Commission as to the payment of inspectors which are sent there by the State Horticultural Commission. The supervisors maintain that the state should bear the expense of a matter which concerns the fruit growers of the entire state, to a greater extent than those at Marysville.

The Ornamental Garden

POTTING PLANTS.

THE country house is seldom supplied with shrubs, hanging baskets and flowers as it should be. They are usually so plentiful in the garden that the lack in the house is not felt. But we are sure a more general cultivation of potted plants will result in much satisfaction. A few bright flowers in pots aid in quickly beautifying a room.

The best way is to have a little lath house or place where the plants may be grown and kept in good condition. Then one should keep twice as many plants as needed in the house or porch at one time. The reason is that a basket hanging in the house or on the porch cannot be given the thorough drenching and the care which it can outside. In time it loses its thrift when it can be placed in the lath house and another put in its place while it takes on new growth.

Then the growing of new plants and potting is fascinating. Cuttings and seed may often be begged and borrowed so that it is not an expensive fad.

Regarding the potting we note the following in the Homestead:

Prepare good soil. Prepare more of it than you need just at this time, because you will require more or less all through the season, as many plants will need re-potting. Pick up old broken pots and crockery and break them up into bits for drainage. Wash old pots well before using them.

Many complain about the failure of plants to live when received by mail or express.

Never pot them at once or, in other words, do not take them out of their wrappings and put them directly in a pot. Set them in a shallow vessel of water and leave them there until the small quantity of soil about the roots has become thoroughly soaked through. If wrapped in moss treat exactly as if sent with earth adhering. In potting, be sure not to use large pots for small plants. This is one reason why so many are lost. The owner does not understand why it is not just as well to put the plants as soon as received in the pots they are to occupy when fully grown as it is to be to the trouble of shifting from time to time. So he puts a small plant in a six or seven-inch pot and it never seems to amount to anything and in the majority of cases it dies. The reason is the young plant has but few roots and those small ones and it cannot digest the food found in a large pot of earth. Its stomach is not equal to the demands made upon it and it dies of dyspepsia or overfeeding. If put into small pots at first it gets all the nutriment it can make use of and soon starts into healthy growth.

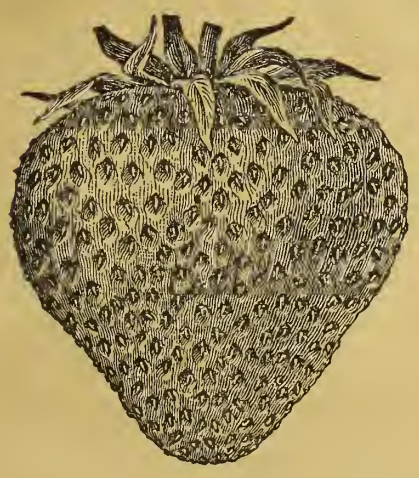
If your pots are new ones soak them well before putting plants in them. Unless you do this the porous clay will absorb most of the moisture from the soil it contains and thus your plant will be robbed of its rights at a critical time. Water well as soon as potted and then place the pots in a shady place and leave them there until you notice signs of growth. Then bring to the sun. Plants in small pots will need watering daily, as the small quantity of earth they hold will dry out rapidily. In potting be very careful not to injure the delicate roots. Spread them out loosely over the soil when the pot is about two-thirds full. Then put a handful of earth on them to settle the compost in about the roots. This is preferable to crowding the soil down. A thorough watering will generally settle the soil quite as firmly as it ought to be about the roots of young plants. Sprinkle all over daily. A moist air is of great benefit to young plants; indeed, it is an item of the greatest importance because plants sent out from a greenhouse miss the damp atmosphere which prevails there and often die in a room where the air is dry.

THE PEPINO.

The pepino is a biennial solanum, rescmbling somewhat the pepper in foliage, but with a tendency to spread out on the ground like the tomato. The flowers are blue, grow in clusters, and are very abundant. The seedless fruit is yellow, splashed with violet, and is about the size and shape of a goose egg on the average. The flavor is somewhat like a musk melon. As a salad it is excellent, and worthy of attention for this use alone. It is never likely to become very popular, however, as too much educational work is required to bring about appreciation.

Of the other fruits tried, such as mangos, eugenias, etc., none do sufficiently well in this climate to justify further attention, and I do not thing it likely that they will ever be a success.—C. P. Taft.

100,000 The Dollar Strawberry



The phenomenal strawberry that has crowded out many of the old standard varieties, and which is now being grown almost exclusively in some of the leading strawberry districts of California. It combines three most desirable characteristics which make it a pronounced success from a commercial standpoint, viz., it is an upright grower, a heavy cropper and good snipper. Of upright growth and shy of runners, it may be planted closer than the average variety, insuring a larger yield per acre. The berries are borne on large crowns and are firm, sweet and juicy. Tne "only" strawberry for California.

Why not send for our new photo illustrated Rose Book? It's a little the finest thing ever published on the rose in the United States, and as well, we are the largest growers of this line in the world. GOOD ROSES, good varieties, ROSES WORTH GROWING, cost you no more than "any old thing" grown and handled in any old way. (Note our guarantee in catalogue.) For the money, labor, etc., judiciously invested nothing in the floral line will yield such satisfactory returns as the ROSE. REMEMBER, WE PAY THE EXPRESS and charge you no more than our neighbor who comes to our place for his roses.

Live Stock and Dairy

By Mrs. Minna E. Sherman

ALFALFA.

THE question was asked at a farmers' institute the other day where the dodder came from, when it suddenly appeared in an old field of alfalfa that had been previously clear of this pest. The seeds are probably carried there by the wind, by the passing of people or animals, and also by the birds. The seeds of the variety of dodder common to California are of the round yellow shape, while there is a form that has the kidney shaped seeds. These would be less readily sifted out. The dodder reminds me of some guests I have known that came for a week and stayed for a season or two. They are at first reasonable and not independent and like the dodder then become a parasite. The dodder when it grows to a certain size reaches out and roots into the side of the stem of an alfalfa shoot, then it stops feeding from the soil and feeds from the sap or juices of the alfalfa. The leaves of the dodder have become mere scales, as they have nothing to do with sustaining the life of the plant. Dodder is usually destroyed by having old hay piled over it and then being burned. Before covering, have a careful man go to spots with a good strong corn knife and cut the alfalfa close below the place where the dodder starts on the stems; pile the hay on the cut portion and then put the freshly cut alfalfa over the top to completely cremate it. Watch the alfalfa fields and see that they are not infested again; cut out the first spots that appear and do not allow them to spread by the seeds.

Bermuda and Morning Glory.

The two other pests of the alfalfa fields are Bermuda grass and morning glory. These are not easily handled like the dodder. They destroy the alfalfa by their dense surface growth completely covering the ground and preventing either sun or rain from reaching the ground. The morning glory plant may be subdued by the use of waste from the wineries; the pomace is full of tartaric acid and if spread over the infested spots of land thickly and let lie there over one season the land will usually be clear of the morning glory. It requires the pomace to be quite thick, say ten inches over the surface, and to extend for a foot or two beyond each side of the spots.

Bermuda grass we know less surely how to destroy. I would not consider it wise at present to plant alfalfa on Bermuda infested land. Johnson grass is not so hard to control as it seems; indeed, we have little trouble with it any more. In the alfalfa field it passes away gradually if the field is made into hay each year. The grass seeds are then never allowed to form; the roots do not penetrate deeply and the plant is greatly weakened. I have seen it pass out of alfalfa fields on the ranch more than once. Alfalfa is a twenty year perennial; it often persists even longer in growing.

I have a vineyard that was once an alfalfa field that has in spots close to the ditch lines, places where there are strong alfalfa roots that are over twenty years old. There is no reason why alfalfa fields could not be made to pay for twenty years or more. The use of gypsum on the alfalfa each fall, only two hundred pounds to the acre, will increase the crop many fold. The gypsum is all the better if it passes through the stables and the manure goes out with it. The manure helps to grow alfalfa and it is well to put it on sometimes. I used to have a manure spreader for this work. At present it is not in order and is a tool that is missed sorely. It is usually not thought worth while to try to increase the amount of alfalfa hay to the acre; this is a mistake, for the more we can grow on an acre the better we are farming, and the cheaper the hay comes in per ton.

Disking.

This is one way of increasing the number of alfalfa plants to the acre. The disks are set straight to run and cut the crowns downwards without tearing them out. The disking is done while the land is soft in the winter time. Then after disking, try sowing some barley and cross disking it in. This will make a crop of mixed hay for the first feeding and may be used for horse hay. The two crops practically will grow on the same land. The foxtail is crowded out and where the alfalfa field is the only land that has not been planted to vines or trees, the hay for the horses is secured. The use of straight alfalfa hay for the horses makes them stock up badly. The older horses on the ranch will come out with badly swelled legs each morning. That this trouble is caused by the alfalfa is proved by changing these horses to barley or wheat hay, when the whole trouble will disappear. Then disking in the barley for the horse hay and cutting the other crops of alfalfa early enough to be soft for the cows, the alfalfa field will answer the double purpose of making all the hay needed. Where an old alfalfa field shows depressions that do not grow alfalfa well, it will pay to fill them, even if the soil is hauled in from a little distance. There are often half days of idleness when these jobs can be done little by little, until in a few years there will be no waste places on the ranch.

Seed.

Once in every year comes a crop of alfalfa particularly fine for seed. If it has been fertilized the year before the entire field will break into deep blue bloom with large heads and perfect blooms. By letting this ripen too far for hay, it can be cut and the seed harvested. The July setting with us gives the best seed. The seed hay may be cut with the common mower and dried. This entails some losses, yet it pays to make your own seeds. Dry and bring the hay into the barn or into a building with a wooden floor; then spread out the masses and whip it with long willow poles; after a few days take up the straw with forks and the seed will be on the floor. Put it through a fan mill and the chaff blows away. If it is to be marketed, screening it will help its appearance further and make it more salable.

Inoculating.

While alfalfa grows well almost anywhere it cannot be started so readily nor will it produce so great an amount of hay as when the soil is freshly inoculated. I take enough of the soil from two to four inches deep off the old alfalfa field and put it in-

Last week was farmers' week in Imperial valley, the institutes being held in nearly every town.

to a trough of water, stirring it well; then stir in the alfalfa seeds and spread them out to dry on a sunny day, planting each afternoon the seeds inoculated in the morning. Another way is to broad cast the earth over the surface of the new field and harrow it in. The earth and seed can be broad cast at the same time. The amount of seed to the acre varies greatly; around here ten pounds is the common amount sown and then the disking is depended on to thicken up the stand. This means waiting for a couple of years to secure the same thickness of stand that sowing 25 pounds to the acre would have secured the first season.—M. E. Sherman.

A BIT OF ANTHRAX HISTORY.

THE following bit of history of the dread disease anthrax is from an address made by Dr. R. T. Whittlesey before a State Convention held in Los Angeles some time ago and later reprinted in pamphlet form by the State Board of Health.

Bacteridian anthrax is the most ancient infectious disease of animals that is known. Moses, in the book of Exodus, speaks of a murrain that affected all the animals of the Egyptians of whatever kind.

Diseases spoken of by Homer, Plutarch, Dionysius, and others of the old writers, were probably no other than anthrax.

Lucretia (428 B. C.) designated it ignus sacer; Columella gave it the name of malignant pustule. Virgil described a disease of the sheep, which was transmitted to man by contact of furs, wool and cadavers, and produced in the integument ulcerating lesions, which extended to the muscles.

The Arabians knew it under the name of Persian fire. Mezenay (966 A. D.) called it St. Anthony's fire.

In the latter part of the fifteenth century, the Senate of Venice prohibited, under penalty of capital punishment, the offering for sale of any meat coming from cattle with anthrax.

In 1617, Athanasius Kisehner gave the description of a disease of the bovines, which was transmissible to man, and which killed sixty thousand people.

It is first noted in Germany and Hungary in 1712; Poland, Silesia, and Saxony, in 1726; in France, in 1731. It invaded Franconia in 1755 to 1761; Finland and Russia, 1758 and 1759; Guadeloupe, 1774.

Chabert, in 1780, has shown that the different forms of anthrax constitute one and the same disease. Kausch, in 1805, gave a good description, but did not recognize its contagiousness.

Anthrax of sheep was well studied by Delaford and Gerlach in 1845; and while Delaford did not believe in its contagiousness, Gerlach demonstrated it experimentally.

In 1850, Heussinger published a work on anthrax, in which he considers it a malarial neurosis. In 1855, Pollinder announced that he had found in the blood of bovines affected with anthrax a quantity of little sticks; these were seen by Davaine in 1850, and Dorpat in 1857. Cohn was the first who considered the little sticks bacilli, and suspected their sporification.

Koch has enlightened us upon the development of spores and their transformation into bacilli.

Preventive inoculation was discovered by Toussaint, and later matured by Pasteur.

The bacteria appear in the living organism, in the form of straight rods, cylindrical and immobile, the extremities distinctly marked, and, in general, their length is about double the diameter of a red-blood corpusele. They are found in all the tissues of cadavers affected by anthrax, but are more plentiful in the spleen.

"MAIL ORDER" AND "JOBBING" CREAM SEPARATORS

We have all heard a lot about the "CHEAPNESS" of the "MAIL ORDER" cream separator, but not so much about that of the "JOBBING" cream separator, and most of us have lost sight of the fact that there naturally isn't much difference between them. THE SAME "CHEAP" CONSIDERATIONS NECESSARILY CONTROL IN EACH CASE.

The "MAIL ORDER" cream separator has got to be MADE "cheap"—because the "mail order" house has got to buy "cheap" in order to sell "cheap," and it may be depended upon to buy as cheap as it can.

The "JOBBING" cream separator—the one which the big implement concern buys and jobs to its dealers—has got to be MADE "cheap"—because the implement concern has got to buy "cheap" in order to re-sell, and it may naturally be depended upon to buy as cheap as it can.

DE LAVAL cream separators are not sold to "MAIL ORDER" concerns—because they cost more to MAKE than "mail order" cream separators cost to SELL. DE LAVAL cream separators are not sold to "JOBBING" houses—because the jobbers cannot buy them "CHEAP" enough and because there is no room for any "jobbing" profit in them.

The BUYER-FOR-USE of a cream separator, like the buyer of anything else, GETS WHAT HE PAYS FOR. If he wants "CHEAPNESS" in first cost he stands to get it in a "MAIL ORDER" or a "JOBBING" separator. If he wants QUALITY and FULL VALUE for his money he is absolutely certain of getting it in a DE LAVAL cream separator.

You pay your money and you take your choice.

PRODUCE MARKETS.—Los Angeles Market; San Francisco Market; Citrus Markets, 622, 623.

COLD WEATHER.

Orange growers of California sat up and took notice during the last few nights of last week that the weather was decidedly chilly. Some who had provided themselves with smudge or heat-making fuel did considerable firing during two or three of the colder nights. The temperature ranged from in some cases possibly as low as 26 and from that up to 38 or 39, which we think was the official temperature at the Los Angeles Weather Station. Fortunately the ground was fairly well filled with moisture, the fruit is ripe enough, so it will take a very severe freeze to do any material injury. Other conditions were favorable to as slight a damage as possible with the temperature which ranged during the coldest nights. Some of the lower and colder sections will doubtless have some injured fruit, but this will be an extremely small proportion of the entire output of the State.

FROST PROTECTION FUEL.

When the chilly weather began last week there were continual requests in this office for information as to where briquettes for frost protection fuel might be secured. Unfortunately the office could give no information of value to such inquirers. A few years ago frost protection received more attention than it has during the past two or three years and a company was formed in Los Angeles for producing the small stoves and the fuel for burning in them. But 4 or 5 years of almost frostless winters have put people to sleep on the frost question and the last year or two there has been practically no demand for this fuel or the stove. The only possible alternative for any company engaged in such business was to die or at least to go out of their business. Now when the need comes, of course there is no method of meeting it.

This situation should impel those who are most vitally concerned to devise some method, either through some large co-operative company, or by inducing private capital to take the matter up, to provide this fuel for emergencies like that which occurred last week. Of course, every section of California is in a "frostless belt" when it comes to advertising literature, but when it comes to a magnificent crop of oranges worth $500 or $1000 an acre hanging on the trees on a cold night, it is very satisfactory to the orchard owner in many of our citrus sections to know that he has at hand means to compel our enemy Jack to stay over the fence.

GOD BLESS US ALL.

The nipping cold weather of the past few days gives a very real tinge to the memories of old times when Santa Claus was supposed to be about with his reindeer and sleigh. We presume the weather conditions which recall the old memories do not increase the Christmas spirit, especially of orange growers. But with it all it has been a very successful and satisfactory year. Some have done ill, some only the average, others have done well. We presume there never was a year when the same general results did not prevail.

Whatever may have been the results of the year's work individually, only good can come from encouraging to the limit the spirit of peace and good will which should prevail at this time. We trust that every reader of the Cultivator will have the utmost limit of happiness and good cheer at this season, and that the successes and mistakes of the past year will be stepping stones to greater successes next year. In the words of Dickens' Tiny Tim, "God bless us all, every one."

NATIONAL LIVE STOCK ASSOCIATION.

Preparations are now being made for a great convention of the members of the American National Live Stock Association which will be held in Los Angeles January 26-28. It is estimated that between 500 and 1000 delegates from all parts of the west will be in attendance. The officers of this association are: President, H. A. Jastro, Bakersfield; vice president, N. McKenzie, Trinidad, Colorado; secretary, T. W. Tomlinson, of Denver, Colorado. Messrs. Jastro and Tomlinson are now in Los Angeles making preparations for a great convention. In his call for the convention, President Jastro says: "Never before in the history of the live stock industry has the need for concerted action been more imperative. Many questions of great interest to stockmen will be considered by Congress and the Legislatures of the different States, and it is vitally important that all concerned in the prosperity of our industry should now forcibly express their views through this national organization."

WALNUT DIP DECISION.

We have seen no public announcement of the recent decision of the Court of Appeals of the case of the Anderson Barngrover Company vs. the Walnut Growers' Associations of Southern California, but we understand a decision has been reached and that it is adverse to the walnut growers. It is rumored that the growers will continue the fight, however, and they still have hopes of ultimately winning this suit. If they do not win, it will be the loss of many hundreds of thousands of dollars to that industry.

BIG PREMIUMS FOR LIVE STOCK.

The management of the Live Stock Department of the Alaska-Yukon Exposition announces an appropriation of $100,000 which has been made for premiums in that one department of the exposition. It is proposed to bring one of the finest collections of animals together ever shown on the coast and to that end this vast sum is to be used as the lodestone which it is hoped will bring to Seattle a string of stock on the 27th day of next September which will rival anything heretofore shown in the United States. The live stock exhibit will last until October 9. Classifications and rules together with a list may be had by addressing the exposition management at Seattle.

BUTTER PRODUCTION OF CALIFORNIA.

According to statements in the synopsis of the report of the State Dairy Bureau, the past year has shown the greatest increase in the production of dairy products of any year in its history. The production of butter in the state during the year ending September 30, 1907, was 44,599,211 pounds; while that for the year ending same date 1908 was 48,469,585 pounds. This production has come up from about 23,000,000 pounds, which was the output for the year 1898.

This increase is doubtless made possible by the rapid introduction of irrigated districts which has encouraged the more extensive production of alfalfa. The counties which have shown the most marked increase are Fresno, Kern, Kings, Merced, Sacramento, San Joaquin, Stanislaus, Tulare and Yolo. Fifteen years ago these counties purchased much of their butter, while today every one is a butter shipping county.

In the matter of prices that for butter has gone higher during the past two years than during the past fifteen years. The average wholesale price for fancy creamery butter on the San Francisco market last year was 30.10 while this year it is 27.8.

The Bureau estimates that the dairies of California turned out products for the year ending September 30, 1908, of a value of $25,224,151.

STATE DAIRY BUREAU.

We are favored by Secretary Saylor of the State Dairy Bureau with an advance synopsis of the Seventh Biennial Report. The members of the Bureau are J. A. Bliss, Alameda county, F. W. Andreasen, Humboldt county, and M. T. Freitas, of Marin county. William H. Saylor is the secretary and chemist in charge of the work. The report deals principally with work of the bureau especially in respect to its enforcement of dairy laws. It refers, however, to the fact that the state board has had employed to cover the entire state only three dairy inspectors. These three have been putting in less than half the time of the year, inspecting over twenty-one hundred dairies, creameries and cheese factories. The board has prosecuted during the year 84 cases, some of them against dairymen for maintaining unsanitary dairies.

The importance of the work of this board and the effect of enforcement of the dairy laws for the good of the industry would be such that the state legislature should give to it more financial support. Instead of three inspectors there should be many in all parts of the state prepared to enforce our dairy laws. There is nothing which so injures the dairy business and the consumption of dairy products as the fact that many of our dairies are so filthy that they are hot beds of bacterial growth. Thorough inspection and enforced cleanliness on the part of these careless ones would have a wonderfully beneficial effect on the entire industry.

PHOSPHATE LANDS.

Upon the recommendation of the National Conservation Commission in Washington, President Roosevelt has instructed the Secretary of the Interior to withdraw from entry public lands in Wyoming, Idaho and Utah which are believed to contain phosphate rock. Phosphoric acid is one of the two substances which must exist in the soil if it is to be productive, and it is considered that at the present rate of production the known available supply will be exhausted in fifty years. The action of the government in withdrawing this land is to prevent its export and consequent reduction of supply to American farmers. The production of 1907 was 2,265,000 tons of phosphate rock; of this amount there was exported 900,000 tons, which is about 40 per cent of the entire production. It is fortunate that this step has been taken as it is of vital interest to every one in the United States who has the welfare of our future agricultural inhabitants at heart.

Agricultural Notes of the Pacific Coast

Northern California

Red Bluffs recently shipped 25 carloads of sheep in one day.

The work of canaling the Yuba City slough is nearly completed.

The precipitation of the recent rain in Colusa county was .51 of an inch.

Farmers near Upper Mattole, Humboldt county, are complaining of too much rain.

Sutter county will have the largest sugar beet farm in the state, over 6000 acres in extent.

One of the finest hop ranches in Sonoma county has recently changed hands, passing to Raford Peterson.

Oroville expects a new pre-cooling plant to be established to enable more perfect shipping for long distance orders.

Coyotes are so fierce in Nevada City that a couple of them recently attacked a man who was compelled to take refuge in a barn.

A number of cattle are being shipped from Shasta county to San Francisco market. Anderson alone shipped 11 carloads recently in one week.

A co-operative movement is on foot among the raspberry and logan berry growers of Santa Rosa to secure more profitable sales of their fruits.

The farmers of Gridley have organized for mutual protection with especial reference to the marketing of fruit so as to secure more profit to the members.

The Sacramento Valley Sugar Company located at Hamilton in Glenn county has rented several hundred acres of land in District Number 70 in Sutter county.

The Alameda Sugar Company is increasing its capacity to handle beets during the coming year by installing three cars of machinery in addition to its former plant.

The creamery men of Humboldt county recently held a meeting at Ferndale. The purpose of the meeting was to bring dairymen and creamery men into closer relationship.

At a recent meeting of the Yolo County Horticultural Commission the organization was perfected by electing August Brink of Winters chairman, and Hayward Reed, secretary.

At a recent meeting of the Calaveras-Alpine Cattlemen's Club it was resolved to offer a reward of $500 for the arrest and conviction of any person caught stealing cattle from any member of the association.

Snow is so deep in Northern Siskiyou county, especially in the Salmon river country, that all wagon travel along the roads has been stopped. It is in order for Easterners to refer to Sunny California in connection with this.

At a recent meeting of the State Agricultural Society at Sacramento at which the directors discussed the premium list for the coming State Fair bids were opened for the Agricultural and Manufacturers' building on the fair grounds.

A Gridley farmer fattened his hogs this season for market by turning them loose in a 200 acre wine grape vineyard. He said that some of the hogs got a "protracted spree on account of some of the grapes fermenting after a heavy rain storm."

Central California

Lindsay shipped 615 cars of oranges up to the present time.

Sanger, Fresno county, has shipped about 75 cars of oranges.

Tulare City shipped last year 1553 cases of honey, averaging 120 pounds per case.

More rain has fallen over the San Joaquin valley than last year up to this date.

W. H. Volck has been reappointed Entomologist of Monterey and Santa Cruz counties.

An extensive planting of the spineless cactus is to be made by farmers about Lindsay.

It is proposed to make extensive plantings of asparagus on the rich land about Lodi.

A string of farmers' institutes covered almost the entire Fresno county last week.

Tulare Grange recently celebrated the forty second anniversary of the founding of the order.

The Southern Pacific demonstration train visited many parts of the San Joaquin valley last week.

Tulare claims the largest eucalyptus nursery in the world, with over two million trees ready for spring planting.

Tulare county is taking the record for the greatest planting of eucalyptus trees of any county in the state.

A Bee Keepers' Institute was held in Fresno last week. Ralph Benton of the College of Agriculture being in charge.

The Tulare County Fair recently held at Exeter netted to the management $1000 after paying all expenses.

Tulare county citrus growers claim that they will ship oranges to the value of a million and a half dollars this year.

The raisin packers of Fresno have proposed to the growers to rent them seeders that the growers may seed their own raisins.

Santa Clara Valley Pioneers Association discussed at length during a recent meeting the manner of handling the forest reserve of this state.

The marketing of raisins is still progressing very slowly, the trade seeming to wait to learn what the new combine of growers proposes to do.

The state hospital located at Agnew, Santa Clara county, has an extensive poultry plant with accommodations for over 1200 hens and brooder accommodations for 2000 chicks.

A new orange and lemon district is being developed, five miles northeast of Sanger, named Orange Cove. As conditions are favorable, this is expected to become a successful citrus colony.

The County Entomologist Association consisting of the entomologists of five counties, namely: Santa Clara, Santa Cruz, Monterey, San Benito and San Mateo, recently held a meeting in San Jose.

A new style of packing table grapes for car shipments is proposed by a fruit grower at Lodi. His plan is to pack in open crates instead of in baskets. The new plan gives access of air to all parts of the fruit.

Southern California

Imperial county has a new highway commission.

Escondido is producing some exceptionally fine lemons this year.

The Brawley people are now assured of the early installation of a skimming plant.

Brawley is looking forward to the early establishment of a milk-skimming station.

Owing to large quantities of feed in the Imperial valley great droves of cattle are being shipped in for the winter feeding.

A large number of pines and native trees are being planted in the Sierra Madre mountains, especially in the San Gabriel reserve.

Riverside has a date palm which is thirty-two years old, now bearing heavily; the present crop is estimated at 300 pounds.

Shipment of citrus fruit from Southern California has been much the lightest this season of any year heretofore up to this date.

The fifteen acre farm of asparagus near Brawley is planning to ship extensively to various coast points during the coming season.

As a rule, the shipment of oranges from most Southern California points has been of most excellent quality and generally fairly ripe.

Ventura county hopes to receive a total of nearly $3,000,000 for her output of beans this year, and nearly another million for sugar beets.

Cantaloupe men of the Imperial valley are still somewhat at sea as regards the situation of the next season's marketing of cantaloupes.

The recent farmers' institute at Beaumont was pronounced very successful and gave a new interest to horticultural work in that section.

This year proves that the California lemon stands a better chance in the general market of the Atlantic Coast cities than does the imported lemon.

State Milk Inspector Starr dropped on the restaurants of San Luis Obispo and several complaints were issued against them for serving milk under standard.

Another magnificent pre-cooling plant is now promised to be located at San Bernardino. It will be built by the Santa Fé Railroad Company and will cost a quarter of a million dollars.

Many urge that the orange growers continue their advertising campaign which was taken up last year in the state of Iowa. It was proved that the consumption was greatly increased by the advertising campaign.

The Santa Ana farmers have begun the planting of sugar beet seed. Contracts aggregating 6000 acres have been signed up. One hundred and thirty thousand pounds of seed have been shipped in and distributed by the Southern California Sugar Company.

The Riverside Press estimate of the coming year's citrus crop is 30,050 cars. The largest producer of oranges of any one section is Redlands with a 4350-car estimate. Riverside estimates quite a shortage over last year's output, or about 4225 cars of oranges with 1075 cars of lemons.

The Coast

Heavy shipments of live stock are being made from Grangeville, Idaho.

Nineteen thousand people attended the National Apple Show at Spokane in one day.

A Vancouver man has sold his entire production of his prune orchard at $105 per ton.

The Oregon State Dairymen's Association recently met in an annual meeting at Salem.

The Idaho State Dairymen Association will meet in annual session at Caldwell, Idaho, January 8-9.

First snow at Wenatchee, Washington, fell on December 8. It was declared to be a very open fall.

Red Butte Creamery Company has filed articles of incorporation, and will operate at Great Falls, Montana.

The sixteenth annual convention of the Northwest Fruit Growers' Association was held at Portland December 2.

Prune growers at Kendrick, Idaho, are holding their crop of prunes for better prices. About ten cars are in hand.

The fifteenth annual meeting of the Washington State Dairymen's Association was held at Chehalis last week.

The State Horticultural Convention of Washington was held at Spokane at the time of the recent apple show.

The fruit growers of Husum, Klickitat county, Washington, have recently organized in order to sell fruit to better advantage.

Seattle has a great shortage of turkeys. It is claimed that practically all the available stock was cleaned up by the Thanksgiving trade.

F. H. Newell of the Reclamation Service has recently been in the Hawaiian Islands with suggestions for reclamation work in those islands.

As a rule the farmers of the Northwest proclaimed their farm life conditions before the Roosevelt Country Life Commission to be almost ideal.

Oregon State Dairy Association is appealing to the legislature for more satisfactory pure food laws, especially with reference to the dairy products.

The University of Idaho is making special efforts to organize the farmers of that section of the State. There have been but two farmer organizations heretofore.

The biggest raid inspectors have ever made on imitation butter was recently made in Denver when 2000 pounds belonging to the Star Creamery was confiscated.

The recent National Apple Show at Spokane opened the eyes of a vast number of people to the importance of the apple industry of the northwest section of this country.

Northwest Grain Growers' Association of Winnipeg, Canada, has issued a circular giving an estimate of the amount of wheat in Manitoba, Saskatchewan and Alberta, an aggregate of 99,311,840 bushels.

An apple grower near Seattle wishing to rid his fruit of pests before sending to market, fumigated so thoroughly that he blistered all the apples so that they were rejected and ordered destroyed on reaching market.

Don't Forget Quality

MIDLAND Poultry Food

Is based on ***quality*** and it is quality in Poultry Food that produces eggs. ***Cheap filler*** and ***cheap grain*** will ***not*** make eggs. ***Midland Poultry Food*** contains only the ***choicest*** cereals and animal food the market affords. Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

BUCKEYES.

THE Buckeye is not well known on the Coast as yet but in the East is attracting attention.

They were originated in Ohio by Mrs. Frank Metcalf, now writing for the Cultivator, and are now adapting themselves to California under Mrs. Metcalf's guidance, though a few of them were tried in the state before she moved here.

Regarding their history and description Mrs. Metcalf writes:

Brief Buckeye History.

I bred Buckeyes as Peacomb R. I. Reds until I saw the R. I. Red Standard was not what I required. I raised both Rose and Single Comb R. I. Reds, and was very successful with them, but found that the dark red birds preferred scored less than the reddish buff birds I disliked. Therefore I called upon Chas. McCalve and T. E. Orr, at that time President and Secretary of the American Poultry Association, to come to our home and advise about the Standard. They both agreed that if we would keep the birds dark red, we must allow for a bar of slate in undercolor, and that the distinctive Gam'y shape and Pea-comb warranted the claim to a breed characteristic of our own, but as the R. I. Red people objected to the use of the word red, we dropped that and had the breed admitted simply as Buckeyes, in Minneapolis, in 1905. I have never pretended that I evolved a show breed, yet in 1907 I showed 50 birds, scoring from 89 to 95 points, 40 of them running 90 and better. The judges who scored them, Eugene Sites and T. E. Orr, both mentioned their uniform appearance, in their speeches after the judging was over.

Description of Buckeyes.

Weight for cock, 9 pounds; cockerel, 8 pounds. Weight for hen, 6 pounds; pullet, 5 pounds.

The Buckeye cock is large, broad breasted, of upright carriage and very stately. In shape resembling Indian Games, but modified by fluffier plumage. He is strong, vigorous and very gallant. In color the richest dark velvety garnet red, with yellow legs and skin.

The new revised Standard demands that the Buckeye hen shall be dark red, with long, deep body which proclaims the great layer, and her eggs are brown or pink in color, and of large size.

Confusion sometimes results as to what a Pea-comb really is. The Pea-comb is a small, close-set comb, having three serrated rows, joined together at the base, the central row higher than the side rows. In short, the Pea-comb looks like three little combs grown together.

Utility Points.

For broilers they are unsurpassed, as they grow so rapidly and have so much breast meat at an early age, while the fine-grained deliciously flavored flesh encased in the tender yellow skin makes a toothsome carcass.

One point about the Buckeye hen has never been fully touched upon, and that is her kind disposition and patience as a sitter and mother.

As egg producers they are the equal of any.

Mrs. Metcalf With a Flock of Buckeyes.

CHICKEN CHAT.

Broiler Raising.

Would you kindly let me know through your paper if there is money in raising friers or broilers every month in the year, even when eggs are the highest? And if there is, are you supposed to sell both males and females? If the pullets are kept, and only the roosters are sold, won't it bring the pullets in to laying for only a short time, and then they will moult? I have always heard that chickens raised in certain months of the year, say September to December, will lay only a short time and then moult.

Please let me know what is best to do. I have a large ranch, abundance of shade, spring water, and well-drained soil for them. Even in the heat of the summer it never gets too warm at the springs, and the ground is always wet and cool. My object is to have young stock for market all the year around if profitable. Kindly write articles in your paper about pigeons. I know very little about them, and have some. Respectfully, Mrs. C. D. E.

Your conditions are as nearly ideal to make broiler-raising profitable as can be found, and a fair trial will convince you that there is profit in it if rightly managed.

The roofing with lasting life—

Genasco
Ready Roofing

Doesn't dry-out, crack, pulverize, rot, nor rust. Keeps its weather-resisting qualities longer than any other roofing, because it is made of Trinidad Lake Asphalt.

POULTRY SHOWS.

San Diego, Dec. 29-Jan. 2—Annual exhibit, San Diego Fanciers' Club, J. F. Goforth, Secretary, San Diego.

Los Angeles, Dec. 30-Jan. 6—Poultry Breeders' Association of Southern California. Dr. C. S. Salisbury, Secretary, Monrovia.

Los Angeles, Jan. 14-18, 1909—The Southwestern Pigeon and Bantam Club at the Made in California Exposition. Mr. Moore of San Francisco and Mr. Frank H. Thomas of Los Angeles will judge.

Los Angeles, Jan. 18-23, 1909—Los Angeles County Poultry Ass'n. Show at Made in California Exposition Building. Manager John D. Mercer, Judges S. Tyler and Frank H. Thomas.

The best way is to sell all cockerels and the poorest of the pullets from each lot, and separate the remainder of the pullets, by fencing in a large piece of ground for their use, thus being able to bring them more slowly to maturity so that when they begin to lay, they will be in a condition and of an age to continue. If let run with the males, they will mate and lay too young, which will cause them to lay one clutch of eggs, then stop for months, perhaps, whether they really moult or not. I don't think it is so much in the month in which they are hatched as in the management after three months of age, that causes this premature laying, and subsequent moulting.

In separating the pullets, be sure and save all of the egg type. Now, it is not a question of fine feathers you want to bear in mind, but you do want to fix the egg-type hen in mind very firmly, and one of the Potter or Hogan books are not to be sneezed at when it comes to this. As you may not feel like investing in one of these, I will try to tell you how to select the egg type without really "giving away" any of the secrets divulged in those books. First, I will give you the feature prized by a wise old farmer away back East, who never thought of "patenting" his idea, and putting it on the market in book form, but which may be quite as valuable, and it is this: For a good layer, select the hen that loks at you with both eyes. This prominence of the eyes and the way they are set in the head will be noticeable after you become accustomed to it, and you will see that those hens have small, neat heads with eyes set well forward, and if you continue the examination, you will see that such hens are bright and sprightly in movement, and usually of the following shape, which is the proper egg type. Long keelbone and long backbone, giving an oblong, not a round-shaped hen. (The keelbone is the bone running from the point of the breastbone back.) Then notice whether the legs are set wide apart, and the wider they are apart the better layer you have.

Now, about setting eggs at 50 cents a dozen for fryers, I wouldn't care to, and you will need some time for rest, so would advise selling the eggs when so high, and aim to produce as many of them as possible by hatching all the time they are low in price.

Pullets of the larger breeds hatched in February and March will begin to lay in August and September, and if they show signs of moulting after lay-

ing a week or two, market them. By learning the position of the "laybones," which the Hogan and Potter systems teach, you can select the ones which have laid their clutch out, from those which are still laying, and make no mistakes.

Leghorns and the smaller breeds hatched in April and May are supposed to make the best winter layers. Articles about pigeons will follow by and by, and meantime, will say that it is supposed pigeons mated for the season remain true even when allowed their freedom afterward. They are said to be like turkeys, one mating fertilizing the whole season's eggs.—Mrs. Frank Metcalf.

TWENTIETH ANNUAL SHOW.

The twentieth annual show of the Los Angeles County Poultry Association will be held January 18 to 23 in the exposition building, 320 South Main street.

This show will be unique in many respects and, owing to the many attractions offered in connection with the show, all under one roof and at the small admission of 10 cents to all, it bids fair to attract the largest attendance ever seen at a western poultry show. This should mean sales and good advertising to the exhibitor and general satisfaction to the visitor. Cash premiums will be awarded, also cups, ribbons and special prizes, some of which will be quite valuable and worth special effort on the part of the exhibitor to win. All exhibitors will be given a season ticket, which admits to many attractions each of which is worth much more than the higher prices usually paid for poor entertainment.

It is regretted that space large enough to accommodate all entries could not be secured, but as it is, the association claims the privilege of refusing all entries after space is filled at the rate of one bird to a coop. What is wanted is a large number of exhibitors rather than a large number of birds and few exhibitors. Entries should be made early. Entry blanks are now ready, but the premium list cannot be published before January 1 to 7, at which time it will be mailed to every one interested whose address can be obtained.

HOW TO DO IT.

Mrs. Basley's new book "What to Do and How to Do It; or 1001 Questions and Answers," is one of the most complete manuals for guiding poultry raisers, whether beginners, or old stagers, that I have ever read. It takes a woman to get at the little things which make Poultry keeping successful, and she has done well in giving us this book, and every one who keeps even one hen should have a copy. The price is $1, and will save many times its cost every year, if used as a guide. Copies may be had through the Cultivator. See "Shop Talk" on editorial page.

Corn may safely be largely used in rations for laying hens, but its use requires unusual care not to overfeed for best results, and it must be supplemented by a liberal proportion of animal food. With such care and so supplemented, the use chiefly of corn, whole or cracked, and corn meal rather than much wheat or corn by-products is attended with the following advantages: Lower food cost. both per day and per egg; rather more eggs; higher average weight of fowls, and better market quality when dressed, and an earlier and better molt.

Animal substances are much more valuable as sources of protein in feeding fowls than vegetable substances, even though the latter contain equal percentages of that nutrient. Concentrated vegetable foods, such as soy bean meal, linseed meal, glutten meals etc., should not be used to replace all or even a very large part of animal foods, such as meat or animal meals, beef scraps, cut bone and meat, etc.

It is not so much in the breed as it is in the breeder if good layers are obtained. Buy those fowls which have been bred to lay. Hatch your chickens early, as they will be well matured by fall. Then feed them properly, provide them with good quarters and they will lay eggs in the winter when prices are highest.

It is not best to use largely grains or meals carrying hard, tough fiber in large proportion. Under otherwise similar conditions the less such fiber in the ration, the better will be the egg product. Oats, barley, buckwheat and by-products containing the husks of these grains should be sparingly used.

General Agriculture

FERTILIZER FOR SUGAR BEETS.

THE purpose in the growth of sugar beets is to obtain the largest total yield of sugar per acre, and inasmuch as the sugar content of the beet as well as its right growth and development, is very largely influenced by the character of the fertilization, this matter becomes of very considerable importance in view of the promising development of the sugar beet industry in this country. In Germany and England, where sugar beets have been grown extensively for several years, the question of fertilizer for that crop has been carefully and systematically studied and much of the information we have has been obtained from across the ocean. We have climatic and soil conditions in California which differ materially from those of Germany, but there are certain fundamental principles in the growing of sugar beets that hold good in both countries. The three elements of plant food required to produce a profitable crop are, nitrogen, phosphoric acid and potash. These fertilizers constituents actually removed by a crop of 10 tons of topped sugar beets per acre as follows:

Nitrogen	44 pounds
Phosphoric acid	20 pounds
Potash	96 pounds

Dr. H. W. Wiley, in treating on this matter in a report to the U. S. Government, says: "As to the relation which the quantity of material returned to the soil should bear to the quantity abstracted by the beet, it may be said in general that it is desirable to return as much nitrogen, from one and a quarter to one and a half times as much potash, and two and a half times as much phosphoric acid, as have been removed by the roots. Greater additions of potash and phosphoric acid have no disadvantageous effect upon the crop."

As stated in the beginning, the object of the growth is to secure not primarily beets, but sugar, and since the sugar formation is not perfected until the absorption of the necessary food from the soil has been in a large part completed, any fertilization, promoting a too rapid, or a too long continued growth, has a tendency to reduce the percentage of sugar; and inasmuch as the maturation takes place largely in the months of the early fall, the growth must be forced early in the season. It is essential that a large and rapid leaf growth is made early in order that the food from the air may be acquired. At this stage of the growth the crop requires large amounts of phosphoric acid, and in order that the crop may obtain the phosphoric acid at this period, it must be soluble and immediately available, hence the large portion of this element should be derived from superphosphates.

Since an application which encourages a steady and continuous growth, rather than an early and rapid one, while producing a large yield, causes a reduction in the sugar content of the beet, the early nitrogen fertilization should consist of the quickly available forms, nitrate or ammonia.

Potash is a very important element, since it gives valuable assistance to the plants' sugar concerting power. Potash in the form of sulphate should be preferably used.

A fertilizer that could no doubt be used to good advantage in California, would analyze:

Nitrogen	4 per cent
Available Phosphoric acid	8 per cent
Actual Potash	9 per cent

This could be used at the rate of from 500 to 800 lbs. per acre, two-thirds to be applied some time before planting and thoroughly mixed with the soil, the remainder just before the first cultivation.

If it is desirable to use the materials unmixed, 50 lbs. nitrate of soda, 400 to 500 lbs. superphosphate and from 80 to 100 lbs. high grade sulphate of potash may be applied easily. Another 50 lbs. of nitrate of soda should be applied as soon as the plants have come up.

Another point to observe in growing beets for sugar and it also has an immediate bearing upon fertilization, is the character of the previous cultivation. Soils should be deeply and well cultivated, since with a shallow and poorly prepared soil, plants would have less opportunity to penetrate deeply, and thus too great a growth above the surface of the ground would be encouraged, with a consequent lowering of both yield and sugar content.—D. I. Duncan.

FARM IMPLEMENTS.

The farm home of today is often within earshot of the clang of trolley cars and is generally supplied with the farm telephone. The isolation which in former years characterized farm life has gone and as a general thing it will likely never be known again. Nearer and nearer the farmer is being drawn to his city brother and more and more modern is he becoming.

Another thing: Farmers are by degrees coming closer to each other. Organization has done much toward this end. A certain brotherhood and friend ship seems to be present among farmers much stronger than such senti ments are found in city folks.

The barnyard of today is not the dumping ground that it was years ago. Machinery is expensive and men take better care of it. Manure has been proved to contain dollars and cents and every atom possible is saved. Hence the absence of much rubbish.

Science has told the farmer there is practically no limit to his productive ability and he has accepted the dictum of science. With the progress of agriculture has come the progress of the farmer himself, and what he gives to the world of his bounty he receives again in many ways from the world. This is typified in the modern inventions which add to the enjoyments and pleasures of country life, and the automobile, telephone, newspaper and railroad have done it and are doing it. What race of people take things more philosophically than the farmer? If crops are bad we seldom hear of the farmer running off and blowing his brains out. He sits down on the fence and thinks it out very carefully, and nine times out of ten profits by experience and sets to work to insure a bumper crop the next year if possible. With the end of the scrub beast will come the glory and independence of the dairyman.—Journal of Agriculture.

Do not work the soil deeply about plants that root close to the surface; merely break the crust with the claw rake, or with the fingers.

Why Drive to Market Yourself

when you can't afford to leave your work on the farm? With a rural telephone you can talk to town at any time, making it possible for a boy to go and attend to the details leaving your time free for other work.

The telephone also enables you to take advantage of fluctuations in the market and sell your products at best prices. But good telephone service depends first upon the quality of the apparatus installed and without good transmission qualities a telephone system is worthless.

Western Electric Rural Telephones

have highest efficiency and reliability with lowest maintenance cost. Our apparatus has high transmission qualities over long as well as short lines and is used by the leading telephone companies of this country.

We have brought the rural telephone within the reach of every farmer, and with our Free Bulletins before him a boy can install and operate the system. Our telephones are guaranteed.

Cut out this advertisement, write your name and address on the margin and mail it to-day so that the Free Bulletins, which describe the entire plan in detail, may be sent you immediately.

Owners of Live Stock in California
Should Insure in Their Own Association,

The California Mutual Live Stock Insurance Association

Because

It is the only institution of the kind organized under the laws of California with the home office in this State.

We insure live stock against death from disease, fire, lightning, tornado, cyclones and every casualty; also through accident which may necessitate the death of any animal.

Losses are paid promptly without discount and without unnecessary delay.

We have a guaranty deposit under the control of the State Treasurer for the protection of our members and policy holders.

There is $100 of values lost to farmers by death of stock, by disease and accident, where $1 is lost by fire.

We have no dividends or profits paid to idle office holders.

The business of the Association is conducted as economically as is consistent with good management, and the earnings are divided among the policy holders.

This is an age of Mutual Insurance, and it is true the cheapest and strongest companies in the United States to-day are composed of and managed by the policy holders, who are farmers and stockmen, as has been demonstrated in the East.

The directors and officers are elected annually by the policy holders.

WHY PAY LARGE PREMIUMS FOR PROFIT TO EASTERN COMPANIES WHEN YOU CAN CO-OPERATE WITH YOUR FELLOW FARMER AND STOCKMAN AND SECURE YOUR INSURANCE AT COST?

A Few of the Many Testimonials We Are Receiving Daily:

Fresno, Calif., August, 29, 1908.

California Mutual Live Stock Ins. Ass'n.,
Los Angeles, California.

Gentlemen:—

We are in receipt of your check for $150, indemnity for the loss of one horse.

We had upon investigation found that your application and by-laws were not complicated, were easy to understand and did not contain so many technicalities as some companies we had investigated that are doing business from foreign states. We also found that this was the only company organized under the State laws of California that was writing live stock insurance in this State. We therefore insured our stock and would not under any consideration do without insurance in your company.

We are more than pleased with the promptness with which payment was made for this loss.

Yours respectfully,
JOHNSON & GREENING.

Los Gatos, August 6th, 1908.

To Whom It May Concern:

This is to certify that I sustained a loss in the California Mutual Live Stock Insurance Association, of which I am a member, to the amount of $350, by the death of two horses. Thanks to the promptness of the Association I have this day received payment in full, through their State agent, Mr. F. H. Hilliker, and cheerfully recommend the Association to all.

I consider it safe, prompt and reliable and an association that all farmers and stock men should go into, as it furnishes absolute protection at cost.

Very respectfully,
FRED LARDER.

Cal. Mutual Live Stock Ins. Ass'n., Newcastle, August 20th. 1908.
Los Angeles, Cal.

Gentlemen:—

Your General Agents, Messrs. Allen & Hunter called on me to-day and handed me your check for $150.00, payment in full for the loss of one of my horses. I certainly appreciate the promptness with which you have met this claim, and I consider it a very good plan to insure our stock against loss by death the same as other property.

I will recommend your Company to my friends.

Wishing you success, Yours resp'y,
RALPH BARNICOTT.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Uusigned communications receive no attention.

J. W. P.

If J. W. P. of Yuba City, and others will write, giving name, his queries will be answered. We do not answer queries which are unsigned. We will not use full name in paper when it is desired to omit.

Peanut Butter Sandwiches.

F. K. H., Pasadena, will find the most delicious peanut butter sandwiches are very simply prepared. Just spread fresh butter on the bread and sprinkle lightly with fresh roasted peanuts, either crushed or chopped finely. If care is taken to have both the butter and peanuts strictly fresh you will never find the rancid taste so often found in prepared peanut butter.—Mrs. H. J. P.

Peanuts.

Will peanuts do well in orchard on sandy soil? Will they be profitable? How shall I cultivate and harvest?—J. F. W., Hanford.

You do not say how large the trees are nor how close together, but if they are at bearing age we do not believe it would be advisable to plant peanuts between the trees. If the trees are just planted it would be possible a few rows might be planted for the first two or three years. But even then care must be exercised to return the fertility which has been removed by the peanut crop. As planting time would not come until several months later than this, we will have information regarding planting and varieties in due season.

Alkali.

What shall I do with alkali land to make it fertile? I have used gypsum and am thinking of applying horse manure. Is it advisable to use this after gypsum? It is a very heavy soil, and will grow alfalfa without irrigation.—A. R., Anaheim.

You do not say what kind of alkali it is, but if it is black alkali your application of gypsum will be beneficial. It is probable the horse manure will be of little value in counteracting the alkali, but as you say it is heavy land it can only benefit by being applied, and there will be only advantage in applying after gypsum. As you say it now grows alfalfa without irrigation, it is probable the per cent. of alkali is not very great. Under draining is the best method of permanently benefiting your land.

Nodules on Peas.

Are Canadian field peas nitrogenous plants? If so, at what age should the root nodules begin to form? I have some planted in October, with over 12 inches growth and no nodules have formed yet.—M. A., Reedley.

The Canadian pea is amongst the best of our nitrogen gatherers. The nodules should have formed before this, and probably would have done so had your seed been treated with soil from a field where peas had been successfully grown before, or with the material which seedmen may supply you with now for inoculation. It is probable that another year this same soil will be in better condition as to these bacteria without further treatment, but it will make your next year's crop doubly sure if you will treat the seed or scatter soil from an old field. But may we ask you if you are sure there are no nodules on the roots? At first they are very tender, and in pulling the plant from the ordinary soil you are more liable to strip all the nodules off than you are to leave them on. If you will dig down beside the plant and then carefully wash the roots out with water under pressure, we are not sure but you will find a fair supply of the nodules. If you do not, it will be proof that your soil is very deficient in this beneficial bacterial life, and to put it in the best condition continual green manuring should be followed.

Lady Bugs.

Where can I procure the lady bugs to put in my orange grove? Are they a remedy for the cottony-cushion scale? What is a good commercial fertilizer for orange trees in this locality? My grove is on the plains near Fresno on a heavy loam, and part of it on very heavy adobe. Is stable manure superior to commercial fertilizer? Is it too late to sow burr clover or vetch?—B. T., Fresno.

The lady bugs, we assume you mean the Vedalia cardinalis from your second question, may be procured by writing State Horticultural Commissioner Jeffrey, Sacramento. It is possible Mr. Jeffrey will want you to send him a few branches of the tree which is infested with the white scale that he may use it for pasture for the young which are constantly being bred in the insectary. That will be the only expense connected with securing the bugs. From your description of your land we imagine stable manure is far superior to commercial fertilizer; that is, you speak of the land as being either very heavy loam or adobe. Such land needs plenty of humus to put it in workable condition. The objection to stable manure is that it is so expensive to handle and hard to secure. The cheapest thing for you on such land would be green manuring. It is now rather late to sow it, but at the same time it will probably give you enough return to cover the cost, and surely will if you have water so as to irrigate and let it stay on the ground as late as the last of March or first of April. As a rule such heavy lands are not so much in need of fertility as they are in need of being put in better condition mechanically by the addition of humus.

Poinsettias.

I sent several poinsettia plants east direct from the nursery. They arrived in good condition and grew finely for two or three weeks when the leaves turned yellow and fell off. What was the cause? Will they come up all right and bloom this year? What should be done for them? I wish you would publish how to care for poinsettias, when and how to prune them, also how best to water them.—E. B., Los Angeles.

Your correspondent does not say at what time the poinsettias were sent east, nor whether they were from pots or open ground, nor whether they were planted in open ground there or in pots and kept indoors. So that it is difficult for me to say just what the trouble was. I judge the plants were chilled and thus dropped their leaves.

The poinsettia was named in honor of Joel R. Poinsette, American Minister to Mexico, who discovered the plant in Mexico in 1828. It is therefore a tropical plant, and the tropics are evergreen; but in this semi-tropical climate it will drop its foliage even in our most sheltered locations. However, in all locations that are free from severe frosts it can be grown sufficiently well to produce its gorgeous bracts of leaves—usually spoken of as flowers. I grew it in large numbers, for many years, in the east, but we either grew in pots or boxes, and took them into the greenhouse early in September. The bracts were wanted for table decorations—usually New Year's Day. Here it is almost universally grown in open ground. After it is done blooming, it should be pruned by cutting back the present year's growth to within 4 to 6 inches of the old wood. The soil should be made very rich by heavy manuring during spring and summer. A good method

YELLOW MONEY AND YELLOW FRUIT

Are a pair that travel together in good shape in an orange or lemon grove. Especially is this true if you will plant only the robust and true-to-name

Citrus Trees

grown by the San Dimas Citrus Nurseries, the largest growers of choice orange and lemon nursery stock in the world. No branch of horticulture offers better inducements in the way of profits, nor is there one more alluring to the person contemplating commercial fruit culture. For the past twenty years we have supplied the leading growers with their trees, and hope to number many more among our friends and patrons. Orders now being booked, subject to future delivery. Send for book on

"The Citrus Fruits: Historically, Horticulturally, Commercially."

Beautifully illustrated, and some 20,000 words of text. Price 25 cents.

The San Dimas Citrus Nurseries
R. M. Teague, Proprietor
San Dimas, California

One grower will plant 70 acres of oranges in one tract at Ducor, Tulare county.

is to make a large basin around the plant and fill it with fresh manure, and then fill the basin with water. It is a rank feeder and will repay an abundance of water and fertilizer. By far the finest bracts I ever saw produced in California were in San Diego county, where a neighbor put all the manure from his chicken house about his plants and watered liberally. If your correspondent's eastern friends still have their plants indoors, they can be kept through the winter by placing them in a warm cellar or furnace room and withholding water—first cutting the young wood back to two or three buds. In May they may be replanted in pots or boxes and grown outdoors until September, when they must be taken inside.—Q. A. L.

Ditch Manuring.

Kindly describe method of manuring orchards by system of deep ditches into which all manure is put and covered up. I have heard of its employment at Riverside but do not know of the details—J. M., Hemet.

Other than forcing under green manure in deeply plowed orchards, we do not know of the system to which you refer, though we have seen orchardists follow the plow, putting in commercial fertilizers in the bottom of the furrow which the next round covers leaving it deep in the ground. If there is any different system followed in Riverside if our subscribers there will give us the details they will be appreciated.

Eucalypts.

I wish to plant some eucalyptus trees and would appreciate some information as to which is the best variety for this section. Soil is a sandy loam, nearly all sub-irrigated but not swampy. Depth to hardpan about three feet. There is some frost at times hard enough to form ice one-fourth inch thick.—E. B., Ceres.

The best answer to that question is to refer to our issue of last week where the different varieties were fully touched upon and their adaptability to different soil and climatic conditions. From that it will be found there are several, but from your description and from the fact you have some frost we imagine the Rostrata or ordinary red gum will be as good as any which you can plant.

A VALUABLE BOOK ON HORTICULTURE.

There has lately been published by the Fancher Creek Nurseries of Fresno, California, what must be regarded as a veritable compendium of information bearing on orchard and garden operations. Its title is suggestive of its scope and character, namely: "California Horticulture: The Fruit Growers' Guide."

The cultural directions cover the salient features essential to every fruit grower in California, commercially; the suggestions governing the planting and the treatment of home grounds are timely and to the point; the enumeration and description of economic and ornamental plants give just what the average planter should know, including the specific and common names, nativity, and habit; the text embraces 125,000 words, and is handsomely illustrated with over a hundred half-tone and two-color plates; the book as a whole making 128 pages 7¾ by 10¾ inches, bound in a beautiful colored cover showing olives and grapes.

The cost of the work was over $5000 for the edition. Copies are, however, to be had for 25 cents by sending to the Fancher Creek Nurseries, Fresno, California.

A test shipment of oranges was made from San Diego by water and by way of the Tehuantepec National Railway and steamer to the Atlantic seaboard. It is reported to have arrived in good condition, and attracts attention to future possibilities of water shipments of fresh fruit.

A Redlands packing-house has a fumigating-room where orchard boxes brought in from one orchard are fumigated before being sent to another. This is to prevent any possible transfer of scale insects.

Eggs at Spokane by the case are now quoted at $14 and $15.

"SPECIAL MERIT" SEAMLESS SCHOOL SHOES

SCHOOL SHOES without seams—think of it—*seamless school shoes!* They are strong and sturdy, have seamless uppers, tough soles and double leather toes. By far the most durable and lasting shoes obtainable.

"Special Merit" Seamless School Shoes *"wear like iron."* They wear just twice as long as ordinary shoes with seams.

Made in all styles and sizes, for every day and Sunday wear—for boys and girls. Your dealer will supply you; if not, write to us. Look for the Mayer Trade Mark on the sole.

FREE—If you will send us the name of a dealer who *does not* handle Special Merit School Shoes, we will send you free, postpaid, a beautiful picture of George or Martha Washington, size 15x20. State which picture you want.

We also make Leading Lady Shoes, Honorbilt Shoes, Martha Washington Comfort Shoes and Yerma Cushion Shoes.

F. Mayer Boot & Shoe Co.
MILWAUKEE, WISCONSIN

WESTERN BRANCH: Washington Shoe Mfg. Co.—Seattle.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Household Department

CALIFORNIA'S YULETIDE.

The time the olive ripens
And the fields are growing green,
The time of salmon sunset hues
With glints of gold between,
When all the soft-curved distances
Stand blue-gray 'gainst the sky
And blue-gray smoke of clearing fires
Is slim and straight and high—

Such is the Christmas-tide with us,
When spring goes hand in hand
With winter and its day of peace—
The Christmas of our land.
The time of busy doings
And of merry doings, when
With all the blessed little ones
We, too, are young again,
When every face bespeaks a friend
And every friend is dear
And days are never long enough
To harbor all our cheer—

Such is the Christmas-time with us,
And, coming, it imparts
An ever richer happiness—
The Christmas of our hearts.
The time of sad-sweet memories,
Of pure and deep content,
When in all thankfulness our heads
Are reverently bent,
When peace renews her home with us,

Because we know her worth
And the halo silv'ring Bethelem
Encircles all the earth.—
Such is the Christmas-time with us,
And solemn music rolls
Its melodies to usher in
The Christmas of our souls.

—Sunset Magazine.

THE HOUSE OF CHILDREN.

THE woman left her dishpan and crossed the small, shabby kitchen with hurried steps. Her arms dripped soddenly and her slight figure sagged at each step in an unbeautiful way.

"You ain't going to stay—you'll be in kind of early tonight, Andrew?" She peered up into his rough face above her, "Just tonight?"

"I'll be in when I get ready," the man muttered.

"Oh, I know—I know— but before morning, Andrew? Say you'll be in before morning! When you stay out so late it scares me." Unvoiced dread was in her tone; she had not yet given name to the dread. But some time— She began again, freshly eager:

"Don't you want to go in and look at the Kid, Andrew? He's dreadful sweet in his sleep. And clean—I always wash him up last thing ever. You like him clean—come on in, Andy."

"No, not tonight, Tilly," but he followed her. The child who was clean and sweet in his sleep drew him like a magnet.

"Look at him!—look at him!" murmured the shabby little mother in a transport of pride. "Look at his curls, will you? And his little hands—ain't they plenty clean enough? And his little feet, Andrew—she pulled down the worn covers and displayed them, white and tiny and pitifully thin. "You never'd think to look at them—"

He caught at her arm, interrupting her. He did not want to think or look at them.

"Cover the Kid up, Tilly! What's got into you to let him get a chill?"

Out in the sharp night he strode away fiercely. He was angry, as if at the thing "you'd never think," looking at his child's little white feet. To Andrew Barry the thing was a continual prod of misery. Because of it he had come to hate all other little children with feet that carried them, shouting, across his path.

Tonight he had started out with a certain sense of elation as befitted one who was an inventor—an originator of a new scheme. Driven to desperation by repeated failures to obtain work he evolved this idea. Something must be done—he would do this. The world owed him and the Kid and Tilly a living. There were honest ways to earn it, but if they failed there was this way. He had already once or twice "practiced" in a modest manner ways distantly akin to this. He was not afraid.

As he strode along the unsavory street, he tried to recall his early evening enthusiasm. Why had Tilly dragged him in to see the Kid? Confound her, why had she pulled the quilts down? Didn't a man need a good, cool head and untroubled mind tonight if he was to make the original scheme a success?

It should be a success! He pulled himself together and swore to forget there were such things as kids in the world. Oddly it did not then occur to him that on tonight, of all nights, since tonight was Kid night, forgetting would not be easy. Or that the existence of kids was of paramount necessity to the New Scheme.

The shopping world as he slunk through it rapidly was all aflame. Lights everywhere, men and women and kids—kids—kids. He ran into them; they ran into him. Their little faces reflected the lights everywhere. They seemed to spring up at him at every step he took and to thrust their joyous faces into his notice. Why were they not at home in their beds? Then he remembered he did not want to think of them at home in their beds. That was the unpleasant part of the New Scheme. It was a thought too closely allied to the little sleeping Kid at home.

Tilly at home was bending over her sewing by now, sitting up close to the flickering lamp. Shirts—Tilly always sewed on shirts. Life to her was made up of the Kid, the unspoken dread when her "man" went out at night—and shirts. There was no gaiety and happy shopping for Tilly, like that of these other women who flitted in and out of the lights like gay-winged moths about candles. There was not even the comfort for Tilly that other women take in kissing their babies' little white feet. Poor Tilly!

The hours that struck clangingly from the city clocks grew larger, and in inverse ratio the crowds in the lighted thoroughfares grew smaller. Presently there were no kids, then fewer women, fewer men. The last Christmas shopping was over. Another year stretched ahead to the next Christmas eve.

The New Scheme was very simple. Its especial value lay in its originality. Andrew Barry had never heard of any one who had "practiced" it; he, himself, he exulted, was its inventor. He meant to make a good thing out of it. To his blunted sensibilities and dwarfed morality its baseness, its utter meanness, did not occur. He was as yet unashamed and hunched along the dark edges of the little city on his way to put it into execution with the effect of hugging himself evilly.

The street he selected was a prosperous one, set on either side with the homes of independent, well-to-do trades-people. On sunny days from end to end it bore evidences of little children—little carts and carriages, dolls and horses. Shrill little voices echoed from house to house; children laughed and cried. It was just the street for the initial trial of the New Scheme. The children on Delweather Street could be relied on to hang up their stockings.

The city clocks tolled midnight, one after the other, in the laggard way of city clocks. But still the man who evilly hugged himself lingered on the dark edge, for still lights shone out cheerfully in the houses that toed the line of the chosen street. It seemed to him that the lights winked at him, daring him to come on. He swore under his breath at the fathers and mothers who stayed up so late.

"One!" struck the clocks in turn, and the single note rang out jovially on the night silences, because it was Christmas morning. The man who waited in the dark swore again. He was getting tired.

The lights went out at length and the little street stretched away darkly, inviting dark deeds. The city being frugally inclined did not maintain all-night illumination on any but its important highways. No disturbing glimmerings interfered now with the carrying out of the New Scheme. Andrew Barry began his work. He selected a house that he had "spotted" as one running over with little children, and it was little children he

This quick-firing "three-shot" gun is the handiest and most up-to-date article ever made in the shot-gun line.

It's yours for $8.00

Sent by express, prepaid, to any address in the United States, upon receipt of price. Absolute satisfaction and safe delivery guaranteed.

The HOPKINS & ALLEN "Three-Shot" Gun

is unequalled for quick shooting. The three shots, one in the gun and two in the clip, can be fired with the rapidity of a repeater. No more missing good shots because your ammunition isn't with your gun. There are always two shells in the clip. No need of keeping a loaded gun in the house—a shell is slipped into the breech at a second's notice. Your gun is always ready for a shot at hawk or game, and you don't have to hunt for shells while the game gets away.

You were never offered a gun as good as this for the price.

Fine decarbonized steel barrels bored full choke for close shooting and deep penetration. Frame case-hardened. Stock and fore-end fine walnut. Top snap action, locks automatically, and joint takes up its own wear. Rebounding hammer, rests in safety notch after firing, eliminating danger of accidental discharge. Hard rubber butt plate. This gun is guaranteed to shoot factory-loaded nitro powder shells. 30 or 32 inch barrels. Automatic ejectors.

1908 GUN GUIDE, FREE!

Our Gun Guide and Catalog for 1908 describes in full 11 styles of double guns, 8 styles of singles, 10 styles of rifles and innumerable kinds of revolvers. Gives lowest prices and offers most complete line. No sportsman or gun lover should be without it. Write for it now.

wanted in a house, for it was in that kind stockings were likeliest to be hung up. He reckoned that here he was sure to find at least half a dozen full ones.

Back in the mean little street where he and the Kid and Tilly lived only one stocking hung. Tilly had waited until he was out of the way before she pinned it to the wall. She sat a long while looking at it, her forehead anxiously knotted. She was trying to solve the problem of making a little tin whistle and two candy suckers fill a stocking.

"I'd ought to bought a horn instead of a whistle," she mused, "Horns fill up better. He'd like to have his stocking full. But, there, he ain't ever had anything full, poor little Kid—without it's his cup o' sorrer." She sighed with the indrawn wail of breath that mothers sigh whose own cups are full.

"He'd ought to have beautiful things in his stocking to make up!" she cried fiercely, in sudden revolt against fate. "If his father—" she got no further. She did not want to think of the Kid's father tonight, because of the dread; it was a dread tonight with a capital "D." She did not want to think of the evil thing he might be doing.

"Not tonight!" she cried, "Not Christmas eve! It'd be bad enough other nights. He might a-stayed to home tonight and filled his Kid's stocking!"

Instead of emptying those of other little children—for that baldly, was the New Scheme. To go about from house to house stealing the Christmas gifts that hung in brave array from chimney-places—a grim, unholy antipode of Santa Claus! It was a thing that no one had ever done before—that Andrew Barry was proud of inventing.

He crept by devious ways—silent, slinking ways that he was not altogether unfamiliar with—into the nursery of the House of Children. By aid of a cheap little dark lantern he could discern the faint outlines of the little stockings. There seemed to be myriads of them. They began with long ones and tapered down to a tiny pair, dangling finely. They were all bulging and knobby and over-running. In some of them there would be sure to be shining gold pieces and valuable jewels. The man crossed the room noiselessly.

A sound of soft breathing disturbed the utter stillness. He turned sharply to find himself passing a row of narrow beds, three of them, set against the wall like the white cots in a hospital ward. The small outlines under the covers did not stir. He flashed his light upon the small faces; they were all sleep-heavy, sleep-sweet. No harm had been done. A moment's quick work and he would be safe. But he had not expected little beds; he could hardly have told why he had not. They disturbed him. The New Scheme seemed threatened by them.

Then he saw the small crutches beside the middle bed. For the space of half a dozen breaths Andrew Barry stood and thought unusual thoughts. They came upon him with a certain stunning effect, as if a blow had descended upon him. Out of the chaos of the thoughts one thing alone was perfectly distinct. He could not rob a room with little crutches in it.

In the Kid's room there were little crutches. They were not polished and cushion-topped like these, but at night they were tilted like these against a narrow bed. He had seen them there so many times when he went home. Tonight they had been there when Tilly made him go in to look at the Kid.

A few moments later he stood outside again, driven out by the crutches with cushion-tops. The blow they had struck his hardening soul still smarted. He found himself battling with new sensations, the predominant one of which filled him with stinging pain. He did not know it was shame. The unaccustomed lash of it turned him dizzy—sent him cursing home. It did not occur to him to go on with the New Scheme.

His wife, Tilly, was sitting up for him. She held the little flaring lamp above her head and waited in the door.

"That you, Andy?" calling softly. He did not answer, but came on stumbling.

"Oh, Andy, you aint—"

No, I aint!"

Then there was that to be thankful for. But there was still the dread.

"You're—you're pretty late, Andy," she hesitated. "Andy, if I thought tonight you'd—you'd—"

"I ain't," he almost shouted, and suddenly he was wildly glad he had not. He looked his wife straight in the face. "I aint, honest, Tilly—honest I aint done it tonight." But the awful nearness appalled him now. When before had he been appalled like this at the proximity of evil?

"Andy! Then I'm going right in and kiss the Kid!—oh, Andy, you come along too! He looks so sweet in his sleep, and I've hung his stocking up, and—and it's merry Christmas, Andy. Come—you come, too."

Strange—strange—the thoughts the little cushioned crutches had set him thinking! He could not get away from them. He followed Tilly, his wife. The Kid looked sweet in his sleep.

"Kiss him—Andy, you just go ahead and kiss him! Stoop over like I do—on his little cheek, Andy. The other one, too—the other one, Andy! Don't it give you a clean feeling to kiss him? Like as if you'd kissed his little clean soul—" She had never been a poet before. She began softly to sob.

Andrew Barry's very being revolted now at the hideousness of the New Scheme. Evil itself—other tempting forms, no less wicked if less hideous—appeared in a glaring new light. He looked down again at the Kid's unconscious little face; the kiss was warm on his own lips. He was the Kid's father; the Kid was his. If for the sake of one's clean-souled little child a man could live clean——

"Andy, see, you'd never think to look at his feet— but he caught her hands away and himself drew the covers back into place. He put out his hands and touched the rough little crutches that had saved him from a hideous sin. For once he was thankful for them.—Country Gentleman.

CHRISTMAS DAINTIES.

MY prejudice against "store" candy dates back to my girlhood when, after eating some candies given me from a church Christmas tree, only the prompt services of a physician saved my life. "Arsenic in the candy colorings," he pronounced the cause of my almost fatal illness. Now that I have five children to supply with Christmas goodies, the making of the annual box of candies merits, I think, considerable attention. To that end, I had clipped from newspapers and cook books a large number of candy recipes before the Cultivator's "Candy Book" appeared for such as I.

By following these carefully, I find it easy to make attractive, wholesome candies at home, at the trifling cost of sugar and flavorings. The secret of the successful candy box lies in its attractiveness and the variety of flavors. One must begin early to save the little tin and pasteboard boxes that accumulate in the house. A few sheets of colored tissue paper and scraps of ribbon transform these boxes into fit receptacles for our goodies.

Weeks before Christmas I begin stowing away the toothsome bites. Suppose we have a fruit cake for the Thanksgiving dinner. I take a slice, cut it into inch cubes, ice the cubes, and there is a handful of delectable rainties for the Christmas box, and no trouble at all! Another day when I am making cookies, I cut some tiny cookies with a thimble, or a fancy shaped cutter, and put them away till another day when I am icing a cake. Out come the little cookies to get a dip in the white, or yellow, or chocolate frosting.

Another day I am looking over some raisins. I select a handful of plump raisins, stick whole cloves in them for head and legs, and behold the perkey looking turtles that make the little boys laugh when they open their Christmas candies.

Another day there are to be prunes cooked for dinner. From these I select large, firm prunes that have been soaked over night, and without cooking them, I press out the seeds, and fill the cavities with blanched almonds, or a ball of fondant, sprinkle heavily with sugar and set away in a warm place to dry. These stuffed prunes improve with age.

During the month of December I keep a lump of fondant on hand to work up with nuts, or chocolate, or cocoanut, into the delicious French creams. A few every day while the children are at school, and the goodies pile up amazingly! That is, provided they are successfully secreted from the children and adults.

This is my quick method of making fondant: Into a granite milkpan I put two cups of sugar with half a cup of water. Set over fire and do not stir, or shake, while boiling briskly. Remove crystals around edge of pan as they accumulate. Test in cold water, by dropping in a small spoonful. When the candy makes a "soft ball" between the fingers, it is ready to remove from fire. Remove promptly, without shaking, and do not pour the candy from the pan in which it is cooked, but let it cool undisturbed till it can be dented with the thumb in the center. Then with a pancake turner for a spatula, I stir and beat the candy into a white, fine-grained mass. Set aside a day, at least.

When ready to mould the fondant, I put a lump into a pint saucepan that fits over the top of a boiling tea kettle. By this means, the fondant melts without danger of scorching. As it melts, I add the desired flavoring, chocolate, nuts, or what not, and shape with the fingers. Set in dry place to harden.

All the caramels, taffies and other sticky candies must be wrapped in paraffine paper—ordinary butter paper does quite well.

No candy box is complete without crystallized fruits and glaces. My easy method is this: Select firm preserves, such as citron, quince or pear, drain from the sirup, spread on tins and sprinkle generously with powdered sugar. Set in dry place for several days to dry thoroughly.

An Oriental sweetmeat worth making is the plump kernals of pumpkin seeds boiled a few minutes in thick sirup, drained, sprinkled with powdered sugar and dried. Look over while drying and separate any that may adhere.—Mrs. King, Gridley.

Feed meal 1.90
Rolled barley 1.65

The richer the food is in protein the more water fowls will drink, because it is required in digestion. The warmer the weather the more they require, because more is thrown off by the body. The more eggs that are laid the more water is consumed, because it is needed in their manufacture.

It is claimed that it is much easier to dress a gosling in warm weather than in cold weather, as the feathers do not set so tight, and in picking them the flesh is not so apt to be torn.—The Industrious Hen.

Two employees of the Oxnard Sugar Company have secured responsible positions in a sugar mill at Los Mochis, Mexico.

San Francisco Markets

SAN FRANCISCO, Dec. 21, 1908.

Butter.

Owing to the cold weather butter has showed an upward tendency during the past few days. It is now very firm. Extras now two and a half cents higher than last week.

The official quotations of the San Francisco Wholesale Dairy Produce Exchange for yesterday are as follows:

California extras per lb....33½

Hay.

The principal activity in hay seems to be in the interior of the State for there are many districts to which hay is being shipped where usually they raise sufficient for their own needs. It is anticipated that this demand will continue until new hay grows again.

The alfalfa market perhaps shows more strength than does the grain hay market for not only is grass backward but furthermore the high price of feed stuff compels dairymen to feed considerably more alfalfa than under normal conditions. The future of the alfalfa market will depend of course upon the grass supply and this as yet cannot be determined. The late rain will undoubtedly give the grass a good start, although later weather conditions will determine whether it will be plentiful or not.

Citrus Market

LOS ANGELES, Dec. 22, 1908.

The orange market for the holiday season closed with a fairly successful return to the grower. No extreme prices have been secured but on the whole the good pack and attractive appearance have won favorable comment.

Lemons are still low with slight demand and little interest.

POTATOES PAY

Make them pay by using the machines that really do the work—

Under the head of "Pointers for the Farmer," the Aspinwall Manufacturin Company, whose advertisement appears in this paper is issuing a leaflet showing the profits to be made from potato production and they, of course, incidentally refer to their splendid line of machinery for helping such production. They make quite a showing and unquestionably prove that the demand for potatoes exceeds the production. It does seem unreasonable that we should import in 1906 1,948,160 bushels of potatoes when they could be reasonably grown in the United States.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths, Fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

University Cereal Improvement Work

Written by Prof. G. W. Shaw and Read at the State Farmers' Institute at the State Farm

CEREAL Improvements is a large topic and because of its various aspects it may be treated of in a number of different ways.

The farmer desires to know and men only generally interested ask the same questions:

(1) How can I get more sacks per acre?

(2) What is the best wheat or barley, as the case may be?

(3) What are you doing here?

Proper culture for cereals on a great deal of our soil is even a greater need than heretofore. The need of better culture is due not only to an impoverished condition brought about by constant cropping and foul fields, but also to a lack of sufficient vegetable matter in the soil. Cereal crops, especially grain crops, show this need of vegetable matter more than root or cultivated crops, because in the case of cultivated crops the culture necessarily given to keep back weeds and conserve the moisture compensates in a measure for the insufficiency of organic material, while in the grain crops where the cultivation can be given only before and at seeding time, the soil soon is packed down and the soil moisture rapidly lost in warmer days. Both are money losing processes for the farmer and both are augmented by a decrease in organic substances in the soil.

Soils must be kept in good physical condition for cereals. Soils that are heavy and pack readily need vegetable matter to make them porous so the air may circulate and incidentally so tillage may be easier, while a light or shallow soil needs vegetable matter to hold moisture; both need vegetable matter as an immediate source of easily available plant food while at the same time its presence is an invaluable factor in aiding the processes of decay and transformation of crude soil materials into forms in which it can become available for succeeding crops. Summer fallowing is practiced for the same reason.

Summer fallowing provides no means of replenishing the store of food, but only makes available a larger amount of the elements already present. On the whole, it is a wasting process and should not be practiced generally. Not only is one season's cropping lost and extra work done without immediate returns, but an actual loss of plant food ensues in spite of the larger crop produced on the fallow ground. Summer fallowing should be practiced principally for storing moisture.

Rotate.

The best way of returning the vegetable matter to the soil is by the frequent growing of alfalfa on a portion of the ranch, and where possible feeding the hay on the ranch, using the manure as a fertilizer. Where this is not possible, green manure crops may be tried, some leguminous crop either alone or with a grass crop. This necessitates the loss of one harvest crop, but it prevents an absolute waste which would follow bare fallow and adds organic matter. Whatever way a rancher manages to keep up his profits in grain growing, whether by changing varieties, by rotation of crops, green manuring, artificially fertilizing, or any other way, he ought to feel it his duty to future soil tillers to so manage that the soil will not become less productive. The time has already come when land owners are heard saying, "that man can't rent any of my land because he robs my farm." Soil management is of first importance, for it is only after men are able to get above average yields through proper soil management and crop rotation that they are ready to grow improved varieties of cereals.

Know the Conditions.

The grain grower must know his surrounding conditions first—and he will find that there are good, medium and poor methods of farm management and good, medium and poor varieties of grain.

There is more difference in profit between poor ranching with common cereals and good ranching with the same cereals than there is between the profits of good ranching with common cereals and good ranching with first class cereals. There are experiments on record which show readily that while a produced variety may increase the profits $1.50 per acre, rotation and culture with a standard variety grown on the same farm show increased net profits of over $3 per acre. This increased profit cannot only be figured, but can actually be obtained by any farmer.

It is manifestly evident that methods of farm management should be of immediate concern to those engaged in cereal production, rather than the consideration of best adapted varieties.

When I am asked what is the best variety of wheat, I frankly answer I do not know. I believe there is no best variety of wheat or oats or barley any more than there is a best kind of stock. When a professor of animal industry recommends a kind of stock he considers the location and purpose for which he is recommending a class of stock and even the humanity in connection, and then recommends a type of cow or horse.

Variety.

In selecting the variety most suitable for any locality it is necessary to find one adapted to climate and soil. For example, in the Sacramento Valley considerable Little Club is grown; in the southern end of the state Sonora, this being a wheat that will do well on less moisture than Club; Club in turn withstands wind, and under this condition, yields more than Sonora. Along the coast region where the atmosphere is damp and where there is less sunshine and little wind, Defiance is a better variety, for it withstands the attack from rusts. In this locality Australian yields better than Club.

Objects of Investigations.

When the Cereal Investigations were established, it had its objects prescribed as follows:

(1) To improve the wheat industry of the Pacific Coast region.

(2) To conduct similar experiments with other cereals.

(3) To determine the effect of change in environment upon the growth of cereals, especially the wheat kernel.

Some of these questions can be studied in any place, but for others it is very necessary to have an even soil and have it for many years. Until last year the Department had no permanent fields. Now we have about forty acres for our exclusive use. This was so laid out that a portion of the tract could be devoted to such experiments as require a long series of years. An example is a fertilizer experiment. We have taken standard fertilizers and have compounded them in various ways and proportions so that they are to answer for us ten questions with regard to the relation of the amount of each element in the soil to thecomposition of the wheat. Aside from this we also get information as to what the soil needs in the way of fertilizer and what combination of fertilizers gives us the larger yield of grain.

Another experiment requiring a series of years is rotation study. We have a series of plats, one constantly sown to wheat, another bare fallowed every year, and others which are green-manured, every other year, using in each case a different kind of pea, bean or vetch with ryes, etc. Along with this experiment we are carrying on a variety test of over sixty varieties of legumes to determine which are the better adapted for use as green manure plants, and also for a forage or a seed crop. The varieties best adapted for green manuring are those that can do well in the early winter and produce the larger mass of water-free substance so early that it may be plowed under, say in February, and allow for a crop of corn or flax or some other crop that can be spring-sown.

According to a common notion it is necessary to change seed occasionally. An average for a series of years at other stations shows that it is not advisable to practice exchanging where home-grown seed is properly cared for.

Experiments to determine the amount of seed to sow of different varieties in order to get the best yield, and to show the effect of drilling against broadcasting seed, of deep against shallow plowing and others to show effect on yield of the time of sowing are included in this list.

The experiment showing the yields of grain from drilled plats as against plats seeded broadcast with a like weight of the same variety of seed seems to be a fairly conclusive one.

Yield.

The average yield in bushels for twelve varieties of wheat was 15.2 bushels in drilled plats, and 11.2 bushels in the plats sown broadcast; in the average yield of four varieties of barley, the difference was 4.9 bushels per acre.

We have heard some pretty good ranchers say that it does not pay to drill grain, but the cost of drilling will not exceed 40 cents per acre while the increased value of the crop is the value of four bushels of wheat or five bushels of barley per acre. At that rate is it worth while to consider a change in methods of sowing? Is a $7 net profit per acre on wheat or $5.50 net profit per acre on barley any inducement to change methods?

Before taking up variety testing, the so-called triangular experiment must be mentioned. It is a coöperation experiment between three widely-separated stations. This is an effort to determine the effect of change of climate on the composition of the harvested wheat.

Variety Tests.

We have about sixty varieties of wheat, about fifty of barley and fourteen varieties of oats in our test plats. Among wheat those varieties that are showing up well are Black Don and Velvet Don among the durums; Japhet, Propo, Club, Minnesota 163, Fretes, Early Baart, California Gem, Club, Galgalos and Kings Early, among the spring wheats; Crimean, Ghirka Winter, and Turkey among the winter varieties. On the whole, the spring wheats yielded better than the durums and the durums better than the winter varieties.

Our best barleys are Common barley, Beldi, White Smyrna, Priceness and Kitzing.

Appler's Rust Proof oats, Texas Red Rust Proof and Red Algerian out-yielded our common oats so far that it seems hardly fair to compare them.

Other Work.

Another division of our work is the hybridizing and subsequent testing of the new types which follow or the testing of selected strains of common varieties. This is the highest type of work connected with the whole subject of wheat improvement.

Save Time—With the Brewster Picking Sack—Save Fruit

A new method sack—invented and perfected by lifelong growers. Eminent orchardists pronounce it perfect. Those who have tried it say they would not be without it. Actual tests show that a man can pick twenty-five per cent more fruit with it and with greater ease.

Sack forms semi-circle about picker's body—is supported by straps over both shoulders and held tight by belt around body. The picker can thus work with ease either on ground or ladder. When full, it does not extend below the hips.

A great feature of the Brewster Sack is the patent gate (see illustration) WHICH PRACTICALLY ELIMINATES BRUISING. Simply unfasten a hook—the gate drops—and the fruit can be quickly but very gently poured out.

The sack holds as much fruit as the old style sack.

Made in two grades.

Regular picking sack grade, sent express prepaid for $1.50.

Special extra quality—that will outlast two ordinary picking sacks—express prepaid $1.75.

Sierra Madre Sack Co., Sierra Madre, Cal.

We want reliable men in every locality to demonstrate this sack and act as our agents.

With the Citrus Growers

CITRUS CONDITIONS IN THE SALT RIVER VALLEY.

FOR some weeks past as the fruit has been packed and marketed the orange groves have been the center of attraction. The fruit has already acquired a good reputation in the eastern markets for its sweetness and fineness of texture, its most prominent claim to salability being the fact that it can easily get into the holiday market in the best possible salable condition. The prices which have been paid for the fruit this year, and which have already been noted in the Cultivator, even in the face of the reported "slump" in the market gives assurance to the growers here that they have not been mistaken in choosing this as a desirable place to enter into the citrus industry and that this early market is practically assured for the future in spite of the competition of Central and Northern California and the Imperial Valley.

The result of this is that there is a great activity in the marketing of those lands which are now classed as being the citrus belt. It appears from the sales of the past few weeks that this craze for land is as great as in Central California or the Imperial Valley, and the average price of such lands is even higher than in either of those places. A prominent real estate man has aptly said that when the big dam was begun, land sales increased enormously, the sales, however, being chiefly to local parties who realized the value of the land in the light of its possibilities and wished to share in its development. Now the tendency is to a subdivision of the larger holdings into lots suitable for the average orange grove, and the man of moderate means, and those who are buying are largely new comers, not only from the East and North and South, but from California itself. Uncertainty has practically given way to certainty in the possibility of producing both the trees and the fruit of a fixed and very desirable type. No advertising scheme is complete, even during the present excitement over sugar beets due to the starting of the big factory and the signing of thousands of acres to the industry, without it contains an attractive item concerning the present and future of the citrus industry here. It must not be supposed that this boom, if it can be called by that term, is without its false prophets and gold-brick dealers both in the sale of land and the development and propagation of trees. Some have appeared and established themselves at considerable expense to prey upon the unsuspecting public. But the dear public is not so gullible in the matter of the selection of lands as it would have been, was indeed, in the earlier development of the industry in California before there was any past experience to draw from. The boundaries of safety in the matter of lands of desirable composition and texture, and the area safely within the limits of frost are so well established by those of experience and so well defended by the reliable real estate dealers who have the future of the business at heart that there is little liability of the greenest buyer being swindled. In the matter of propagation there are certain barriers, fortunately for the growers, perhaps, which tend to make this work more difficult than in the average nurseries of California, and this has already driven several speculators, lacking in both reliability and experience, out of the business. Yet the difficulties in the way of successful propagation have been overcome and the nursery business is well established and on the way to supply in the near future the demands of the whole Territory. Differences from California exist in the care of the seed beds and young trees, their protection from heat and from the salt of the water and in the time of planting and budding. The cost of learning these primary points has been borne by local firms who have the capital to suffer some loss, and the indications are that their efforts will be rewarded by the propagation of a bountiful supply of trees of known quality, acclimated and free from injurious pests.

One of the most striking features of the citrus trees and fruit here is this freedom from pests of all kinds. The fruit without washing is as clean and bright as the best anywhere, and the orchardists are not put to the expense of fighting for this cleanliness of fruit and trees. Through the medium of consistent agitation they have recognized the immense importance of this, and there is a movement on foot to have all importations inspected at the depots. A bill will soon be presented to the Legislature establishing regular officers for this work. In the meantime, it is being done by other means, and every effort is being made to tide the thing over until the law is enacted and comes into force. Growers and shippers generally have come to recognize who are the reliable nurserymen to ship from in both California and Florida, and their stuff is being secured, even though a higher price must be paid for their product.

There is considerable talk among the trade journals concerning the probability of the holiday market being overstocked, and many predict eventual "flabbiness" of this market when the great Imperial Valley and other sections come into their own. It does not appear to persons familiar with conditions that there is any more danger of overstocking this market than that which comes later and is filled by the much greater shipments of the larger citrus belt of California. Those who are in a position to get into this market have no fear of its future or of their ability to produce stuff that will maintain prices during that season.—B. J. Jones, Phoenix.

IRRIGATE FOR GOOD LEMONS.

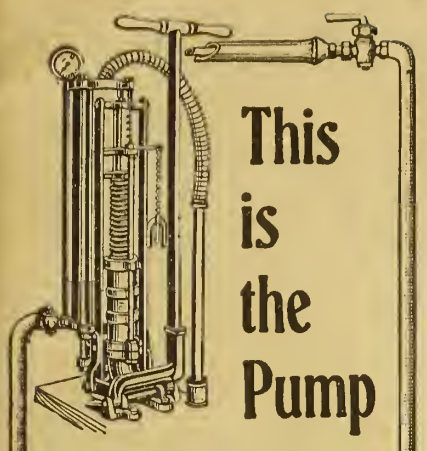
"Lemon growers in this valley will not be permanently prosperous and reap the profiit from the fruit that they ought to till they stop depending on the rainy season and irrigate," says Manager Bell of the Cahuenga Valley Lemon Exchange.

"It costs more in the long run to wait for the rainy season than it does to pay for the water. I think all farming in this part of the state would be much more profitable in the end if irrigation were employed.

"As it is, the lemon growers are not getting nearly as much out of their fruit as they could with more water."

Most Southern California packing-houses are quiet places after the busy holiday shipping, and will be until the January shipments begin a few weeks later.

Fires were a common sight during the cool nights of last week in many orange groves.



This is the Pump

that can be operated continuously at high pressure without the muscle-racking, exhausting, "man killing" exertion required for ordinary pumps. High pressure spraying means more and better fruit—and consequently more money for the grower.

Bean Magic Spray Pumps

are different from other pumps. They run smoothly and easily without clogging, and one man keeps up high pressure for two lines of hose. And they **save one-third the labor.** The Bean patent spring does it. The operator does half the work at each stroke of the handle, and works against but half the pressure indicated on the gauge. A trial quickly removes all doubt.

Our illustrated catalog No. 21 describes ten sizes of handpumps, and contains much valuable spray information, and formulas. Catalog No. 18 describes Power Sprayers. Both books sent free. Write for our special offer; state number of acres and kind of fruit.

INVASION BY EXPRESS COMPANIES.

Mr. Edward Berwick of Pacific Grove writes as follows:

"Doubts have been expressed in many places as to whether the carrying of parcels is a legitimate function of our postoffice. Machine-made Congressmen, working in the interests of transportation companies rather than in the interests of the people, have done their best by decrying the parcels post, as something that the people's postoffice had no right to institute. The address of Mr. Nathan B. Williams of Fayetteville, Ark., that I send you herewith, will, I think, prove both pleasant and instructive reading to your many readers who are interested in having our postoffice carry out fully the work for which it was established. It will be seen that the express companies, and not the postoffice authorities, are the interlopers; and that the former are liable for penalties for infringing on the privileges of the latter."

We regret that the address of Mr. Williams is so long that it is impossible to reprint. But from it we quote:

"The one great department of the government which affects the daily life of all its citizens and contributes most largely to their comfort and enlightenment is the postal service. The record of its growth embraces the history of the subjection of this mighty continent to the support and development of a great people. Its service extends to the most inaccessible places. The mails stop at no obstacles; they halt, neither for summer's heat nor winter's cold. By all the resources of a great nation, is mail matter hastened to all the people. Such has been the beneficent effects of the widest extension of this service, that the Congress, so far, has never hesitated to make apppropriations from other sources to meet the postal deficit.

"It is not certain, however, as we shall see later, that any such deficit in postal revenues would have occurred, at least for many years, but for the fact that the government, in our opinion, has permitted the express companies of the country to invade the province of the government in the carriage of mail matter and to violate the plain statute law of the nation without hindrance or molestation.

"The framers of the constitution in enumerating the powers of Congress, provided: 'The Congress shall have power—To establish postoffices and post roads,' and the development of the postal service of the United States has grown from these few simple words, found in Section 8 of the Constitution of the United States.

"In the development of the power contained in the quoted provision of the Constitution, Congress has determined what are post roads, and its last expression on the subject is: that all the waters of the United States, all railroads or parts of railroads, all canals, all plank roads, all letter-carrier routes and all public roads and highways are post roads. As such, they are subject to the jurisdiction of the Congress in all matters affecting the carrying of mail matter thereon.

"In the early days Congress appropriated money for opening and keeping in repair stage roads to the interior, in order that the mails might follow the sturdy pioneer and his family and afford them the means of communication by keeping in touch with the activities of the government. As communities became more populous and better able to open and maintain their own roads, over which the government stage coach and post rider were accustomed to pass, the use of government money for this purpose declined, but a little later it was determined expedient to subsidize railways, owing to the superior facilities which such means afforded in the carriage of mail matter."

Then follows a definition of mail matter, which is divided into four classes, the fourth being "merchandise," to which the remainder of the address gives the greater attention.

Any one who feels that the government is "usurping" the field of the parcels post should secure a copy of this address, for it treats the subject most fully and legaly.

Deciduous Fruit Culture

By J. W. Mills

PUTTING HUMUS INTO VINEYARDS.

IT does not seem to be an easy matter to grow stuff in the vineyard for green manuring crops; still it should not be a difficult problem. When growers get used to the difficulties in following the practice, half of the battle is won. For many years, one of the standing topics for discussion in the numerous farmers' clubs of Southern California, was the best methods of handling green manuring crops in the orchard. Its pros and cons were thrashed out year after year till the almost universal conclusion was, that to get them in early when provision for irrigating could be made, plant the whole area between trees in the direction of irrigation furrows, grow as much as possible and turn it under early enough in the spring to allow the late rains to settle the ground and rot the green stuff, was the best practice.

One of the objections that was most difficult to overcome was that of planting every space between the rows. Most growers were quite positive that it would not do to have all the spaces filled with growing green stuff during the time of picking and hauling out the fruit. The grass would be too wet after rains and heavy dews and the teams would injure the green crops. Now in the case of the vineyardist, this period of the green crop would interfere more or less with pruning and clearing the vineyard of brush. The fire-sled would solve that phase of the subject and for those who do not practice burning the prunings in the vineyard, every-other space could be left unplanted. Prunings could be thrown into this and dragged out.

In the case of long rows and heavy prunings it would be necessary to prune one row and drag the brush out before pruning the next row. No doubt, after a trial has been made of planting the vineyard solid, the grape growers will conclude that it is the better way, just as the Southern California orange grower did. It is the better way theoretically and practically. It would seem that enough of the green crop would be left to make it worth while even if some of it is killed and besides the protection afforded by the green stuff prevents the soil from becoming slicked over.

The brush can be dragged out, hauled on a sled or burned on a sled sooner after a rain than it would be possible with the ground bare. In the handling of oranges, this has been proven to be the case. Where alternate spaces are planted to green manuring crops, the whole vineyard can be sown once in two years by shifting the planting one space each year.

What to Plant.

There are two great divisions of plant life, both of which supply humus to the soil during their process of decomposition. The plants of one of these great divisions supply humus poor or totally devoid of nitrogen, the other furnishing a high percentage of nitrogen. As nitrogen is the most expensive fertilizer that we have to buy, it requires no second thought for us to select the class of plants that furnishes this. All plants belonging to the pea and bean family do this and it is quite conclusively shown that it is due to a certain growth on the roots. When a crop of this sort is grown, considerable fertility is added to the soil even where the tops are removed as in the case of a hay crop.

After many years of experimenting in Southern California, it was found that the Canada field pea and winter vetch gave the best results. The first named is losing in popularity because it must be plowed in or disked before it nears maturity or it becomes very fibrous and tough and requires a long time in which to rot. It will often appear to be in a good succulent condition and a few days north wind will toughen it so as to make it almost impossible to handle. With vetch it is different. It will remain tender and succulent through all kinds of weather and up to the time the pods begin to mature.

How to Plant.

The seed may be sown with a drill, 40 pounds per acre, or broadcast, 60 pounds per acre. As the price of seed is quite high, ranging from 3 cents to 5 cents per pound, it is most economical to plant with a drill. Any grain or fertilizer drill will do the the work. The seed should be put in early so that the first rain will start it. Where irrigation is convenient, a heavy crop could be secured by wetting the soil and planting immediately after picking the grapes. It often happens that it is to advantage to irrigate during the winter or in the spring shortly before plowing time. In vineyards where this is feasible, the irrigation furrows should be made at the time of planting the seed. When the seed is sown broadcast, two bull-tongue furrowing shovels like those on a lister should be run about four feet apart. Where a seed drill is used these can be attached so as to follow between two drills—dividing the space so that the two furrows will soak up the space alike, clear across.—J. W. Mills.

PLANTING THE APPLE TREE.

IT is not every one who can properly plant a tree. From the time trees leave the nursery until they are permanently planted they should be exposed just as little as possible. They should never be left open to sun or wind or air when it can at all be avoided. Trees waiting for planting should be heeled in with moist earth about the roots and only taken out of the ground when actually needed for setting. The hole dug for a tree should be large enough so that the roots may be spread out naturally in all directions. Yet it is not necessary to dig wide holes if the trees are heavy-rooted, for the roots of a tree always need trimming back at transplanting time. Cut back all roots, leaving a clean-cut surface. Remove all broken or torn roots and those that have become dried or dead. The cut surfaces should always show fresh living wood. When these clean-cut surfaces come in contact with moist soil the cambium grows out over the end and forms a callus, from which new roots start very readily.

The filling-in of the holes is the most important step in the work of tree planting. To get the best results moist soil must be placed closely about the roots, so that there are no air holes or crevices. The best instrument for accomplishing this work

is the human hand. When the tree is placed in position the roots are spread out and a shovelful or two of the finest and best earth thrown in upon them. This should be carefully worked into the crevices with the fingers, and when the hole is about a third full the dirt about the roots of the trees should be tramped down solid. Moving the tree up and down while the earth is being thrown in will assist materially in avoiding air holes and in bringing the soil into close contact with all the roots. There is little danger of packing the earth too much, but trees often die for lack of tramping. After the roots are well covered and packed in tightly the hole may be filled with the remainder of the earth. Trees should be set in the orchard no deeper than they stood in the nursery. Deep setting is almost as injurious as too shallow setting. The collar of the tree is the natural indicator of the proper depth of planting. The surface should be left loose; tramping it would pack the soil so that it would lose moisture and dry out the tree. In planting trees do not pour water into the holes, for a slightly moist soil is much better than a very wet one. The proper distance for setting standard apple trees is not less than 35 feet.

Since the root surface has been reduced in transplanting the tree, it is necessary to cut back the top in similar proportion to maintain a balance between top and root. If this is not done, when the tree comes into leaf the foliage will give off moisture faster than the reduced roots can supply it, and so the tree is dried out and killed. From Bulletin of North Carolina Dept. of Agr.

NEW RICE INDUSTRY.

The National Department of Agriculture benefits all sections. A comparatively few years ago practically all of our home crop of rice was grown on the Atlantic Coast; the methods of handling it were more or less primitive, the production small, and the country was a large importer of rice. Twenty or twenty-five years ago the costal plains lands of Louisiana and Texas were pointed out as a region for successful rice culture. They were used largely as cattle ranges and were selling at from $1 to $2 per acre. With the introduction and successful production of rice, the cost of land rapidly increased, and the farmers of this region saw the need for improved methods of handling this crop. Many were pioneers from the great wheat-growing states due north—Iowa, Kansas, Minnesota, Wisconsin, Illinois and Indiana. They brought south with them the implements they had used in growing wheat—the gang-plough, drill, self-binder, header and other modern implements—and methods and ideas never before applied to rice culture, making it possible to produce a much larger quantity of rice per man than ever was oefore.

A question arose as to the competition of Oriental countries in the production of rice, and one of the department's most capable men demonstrated that one American, with modern equipment, can produce as much rice as three hundred Orientals.—National Magazine for October.

Imperial Valley Lands have a greater earning capacity per acre than any land on earth. For price list and information address, James S. White Jr., and R. A. Holt, Holtville, Cal.

The Ornamental Garden

HANGING BASKETS.

There is no class of plants so neglected as those in hanging baskets. In their exposed position they dry out very rapidly, and are often given only a little water on top. The roots that need moisture so much seldom receive any, and these baskets are anything but ornaments. They should be taken down at least once a week, placed in a tub of water and left there for half an hour. All of the plants should be submerged. In very dry weather this should be done twice a week, then they will be things of living green, instead of withered, sickly plants. A little liquid fertilizer given while they are wet will cause them to make more rapid growth, and if of blooming kinds will cause more buds to appear. Ammonia is the cleanest fertilizer to use. One teaspoonful to one gallon of water can be given once or twice a week.

One of the most popular plants for baskets is the Asparagus Sprengeri. This is one of the most easily grown and prettiest plants for this purpose. The fronds are of a rich shade of green, and often four feet in length, and will retain their dainty green in a dry atmosphere, but will not make much growth without moisture.

The Vinca Minor variegata, a trailing plant, is admirably adapted for a hanging basket; the Tradescantia multicolor or Wandering Jew, and the Ice Plant, make beautiful trailing plants for this purpose, but are flowerless. There are some trailers that bloom and make exceedingly showy basket plants. The Weeping Lantana is very graceful, grows rapidly, and blooms continually, producing large clusters of flowers of the most delicate lilac, or rosy pink, and the foliage is very attractive. The Kenilworth Ivy is a most delicate trailer, has dainty blooms and is easily grown. The Trailing Queen Fuchsia, Russelia elegantissima and the Ivy Geraniums, all make excellent basket plants, and can be kept from year to year, increasing in beauty each year. —Park's Magazine.

REPAIRS.

Slovenly indeed is the place which is not kept in good repair. A tottering fence, a sagging gate, a hingeless door, a paneless sash, a roof lacking shingles here and there, a side of a building showing cracks every now and then, are all evidence of shiftlessness or of absence of foresight or of lack of proper energy. Prompt repairs are necessary not only for economy and convenience, but for attractiveness. When one hinge has become broken it takes but a short time for the other to go in the same way. It takes only a little while for the tottering fence to fall on its side, for the hole in the roof to become larger, for the crack in the side of the building to become extended. In making your repairs do not go at your task in a half-hearted manner, doing a temporary job and putting off the final mending. Do not attempt to prop up the tottering fence with sticks as weak as the fence itself in a vain effort to make the infirm support the infirm. Do not mend the broken hinge with a piece of baled-hay wire, thereby doing a clumsy and inefficient job. Do not stop up the openings in the sash with pieces of old shingles or of tin. Be a man! Go at your task of repairs with courage. See to it that when your work is completed the thing is as serviceable and as attractive in appearance as ever it was.

Now shall we not read what William Morris writes in regard to neatness: "Still more is this necessary, cleanliness and decency everywhere, in the cottage as well as in the palace; the lack of that is a serious piece of manners for us to correct; that lack and all the inequalities of life, and the heaped-up thoughtlessness and disorder of so many centuries that cause it; and as yet it is only a very few men who have begun to think about a remedy for it in its widest range." —Green's Fruit Grower.

THE BLACKWOOD BEAUTIFUL IN AGE.

Acacia melanoxylon is one of our most popular street trees and is no doubt more extensively planted in Southern California than any other at present. A literal translation of its specific name, melanoxylon, is blackwood and it is under this name best known locally. It belongs to the entire leaved group of acacias as distinguished from the fern-leaved section of the family.

In its native Australia it is an inhabitant of the rich river bottom lands and is not considered among the drought-resistant acacias. In fact, it has often perished here in Southern California along our foothills where soil was well drained and no soil moisture available except at a great depth. It has been slowly killed in a number of cases where it struck hardpan, even at a considerable depth, and a row is known to have died slowly where the hardpan was close to the surface at the first tree and many feet below at the last of the row. Twenty years elapsed before the last tree succumbed. In youth the tree is not handsome, for it assumes a spire-like growth, which becomes more accentuated with advancing years until it attains its ultimate height or nearly so, and then begins to spread. In some sections it attains a considerable height, but in general it begins to grow umbrageous when 30 to 40 feet high. When of age it becomes a handsome, spreading tree of great shade-giving capacity.—Los Angeles Times.

"TREE OF HEAVEN."

Among the common trees yet almost totally unknown in this western country is the much despised, ill-smelling ailanthus or heaven tree of China. A million dollars could not buy a board in any lumber yard. No dealer or manufacturer of lumber ever saw it on sale and would not recognize it if seen. Yet it is a magnificent wood, resembling white ash, and capable of receiving a high polish. The tree is a native of the Molucca islands, just south of the equator and not far from Borneo. There it forms a large forest tree. It was brought from China during the first decade of the nineteenth century and has gradually spread over the United States. It is planted for shade only. The male trees are very offensive while in blossom but the female trees have no such odor. They have a tropical appearance, spread by underground roots, suckering like the black locust so as to make them a nuisance on the lawn. The ailanthus has run wild in some places. Groups of the trees are quite frequently found where apparently birds have taken the clusters of winged seeds for lining their nests, some of the seeds thus escaping them.—Denver Field and Farm.

The Poultry Shows

KINGS COUNTY POULTRY SHOW.

THE members of the Kings' County Poultry and Pet Stock Association are congratulating themselves over the successful show recently held at Hanford. The attendance was larger than at any former show held by this association and as to quality of the stock exhibited, a higher standard was maintained and much favorable comment won by all exhibits. Nearly all classes were well filled and the winners were high grade birds.

The best display for exhibit outside of Kings county was one by J. F. Forney of Kingsburg, Fresno county. The prize cup for the best display of all varieties was won by Henry Starr. The best pair, E. E. Ford. The best pen, M. Bassett. Best pullet, C. L. Newport. The best male bird, J. J. Verkouteren. Best display by one exhibitor in Kings county, M. Bassett. The best six birds in the show was won by C. L. Newport. Best display of barred rocks, one exhibitor, M. Bassett. Best display of White Rocks, C. L. Newport. Best display of Golden Wyandottes, C. L. Newport. Best display of White Wyandottes, E. E. Ford. Display of Buff Wyandottes, W. F. Huesel. Silver Wyandottes, W. F. Huesel. Best display of Dark Brahmas, Henry Starr. Best display of White Legnorns, J. F. Forney. Best display of S. C. Buff Orpingtons, G. L. Meadows. Blue Andalusians, G. L. Meadows, Black Minorcas, M. Bassett. White Minorcas, J. Cecil. Silver Hamburgs, B. P. Shirk, Black Orpingtons, J. J. Verkouteren. Games, M. A. Hill. Best display of pigeons, E. F. Bradley. Turkeys, M. Bassett. Ducks, B. P. Shirk.

The above were special winners. In the regular classes, the winners were as follows: White Leghorns, J. F. Forney, J. Cecil and C. V. Webb. Buff Leghorns, Meadows and M. Bassett. Brown Leghorns, J. J. Verkouteren. Black Minorcas, M. Bassett. White Minorcas, J. Cecil and M. A. Hill. Blue Andalusians, G. L. Meadows. Silver Hamburgs, C. P. Shirk.

Americans.

Rhode Island Reds, E. F. Bradley. Columbian Wyandottes, G. J. F. Fourney, Buff Wyandottes, W. F. Huesel. Silver Wyandottes, W. F. Huesel. White Wyandottes E. C. Ford, C. L. Elmore and E. F. Bradley. Golden Wyandottes, E. E. Ford, G. L. Meadows.

White Plymouth Rocks, E. L. Newport, B. P. Shirk. Barred Plymouth Rocks, M. Bassett, C. L. Newport.

English.

Cornish Fowls, M. A. Hill and G. L. Meadows. Buff Orpingtons, E. F. Bradley, G. L. Meadows, J. Cecil, J. R. High. White Orpingtons, J. J. Verkouteren. Black Orpingtons, J. J. Verkouteren and G. L. Meadows.

Asiatics.

Dark Brahmas, Henry Starr.

Ducks and Turkeys.

In ducks, J. R. High won all prizes on the Buff Orpingtons, B. P. Shirk on the Pekins.

In Bronze Turkeys, Geo. A. Smith, M. Bassett and R. M. Dodge were the winners.

The contest for the President's Cup was spirited, M. Bassett's birds scoring 119 points, J. Cecil 107 and G. L. Meadows 97.

Judge R. J. Venn of Fresno was the judge of the show.

PETALUMA SHOW.

RECENT four day exhibition of some of the choicest poultry in the state of California at Dreamland Rink, Petaluma, closed with so much success that the members of the Petaluma association feel great satisfaction.

The judges of the show were Mr. Henry Berrar of San Jose, and R. J. Venn of Fresno. Most of the classes were full and the judges pronounced the quality very satisfactory.

H. R. Gray kindly sends us a full list of the awards which we regret we cannot publish entire, but from it we note that in the special prizes the cup for the best bird in the show was won by R. J. Mott. Largest number of entries, V. G. Huntley. Best display, V. G. Huntley. Best collection of White Leghorns, F. E. Baldwin. Best collection in Mediterranean class, not including White Leghorns, V. G. Huntley. Best collection in American class, not including Plymouth Rocks, J. Stansfield. Best collection in French class, J. Sayles. English class, Mrs. S. Swaysgood. Buff Orpingtons, W. S. Sullivan. Asiatics, C. E. Ross, Polish and Dutch class, Mrs. D. A. Robertson. Ornamental Bantams, Moore & Mann. Ducks, Turkeys and Geese, V. G. Huntley. Novice class, A. B. Smith. Best display from Sonoma county, V. G. Huntley. Best cockerel, hen and pullet, in novice class, H. D. Anderson. Barred Plymouth Rocks, Moore & Mann. Plymouth Rocks other than barred, D. A. Robertson. Best pair Houdans, R. J. Mott. Best pen of White Leghorns in novice class, John Paul Sayles. Best collection of pigeons, L. C. Byce and Sons.

The $50 challenge cup for best S. C. White Leghorn cockerel, hen and pullet, won by Lippitt & Lippitt.

Americans.

The winners of the regular American class were as follows. Barred Rocks, Moore & Mann, H. R. Campbell. White Rocks, P. D. Culver, Mrs. D. A. Robertson, A. J. Welch.

White Wyandottes, J. L. Dinwiddie, F. J. Hellen, J. Stansfield. Silver Penciled Wyandottes, Mrs. G. E. Gindell. Silver Laced Wyandottes, J. Stansfield. Black Wyandottes, J. Stansfield. Columbian Wyandottes, George Leaman.

S. C. Rhode Island Reds, R. J. Mott.

Asiatic.

Buff Cochins, G. E. Ross and C. E. Camm. Partridge Cochins, Mrs. F. A. Burton.

Mediterranean Class.

Brown Leghorns, A. B. Smith. Buff Leghorns, B. G. Huntley. White Leghorns, Carl Gregory, F. E. Baldwin, C. B. Carrington, Model Poultry Farm. S. C. Black Minorcas, V. G. Huntley. S. C. White Minorcas, C. H. Vaughn. Blue Andalusians, G. L. Meadows, H. P. Lichau, Jr.

English.

S. C. Buff Orpington, H. D. Anderson, W. S. Sullivan. Black Orpingtons, V. G. Huntley, A. J. Welsh. White Orpingtons, Mrs. S. Swaysgood, Dr. N. Wallis, G. A. Pool. Cornish Fowls, V. G. Huntley.

French.

Bronze, A. J. Snow, V. G. Huntley. White Holland, Denny & Irons.

Ducks.

Aylesbury, V. G. Huntley.
Pekins, John A. Evans, Rancho Los Encinas.

POMONA SHOW.

THE second annual show of the Pomona Valley Association was held at Pomona December 14 to 19. The show was under the management of C. C. McKey and was staged in the skating rink building which made one of the best rooms for this purpose in Southern California. The judging was done and ribbons up before the exhibition was opened to the public.

The association offered handsome ribbons on all Standard varieties of poultry and water fowl. There was also a number of handsome cups, which were donated by the generous merchants of Pomona which brought out a good number of birds, many of which were of high quality.

In the American class the white rocks took the lead with some extra quality birds which were shown by Ed Gutting of Los Angeles. The White Wyandottes was also a strong class; although not so large as the rocks yet had quality.

Mrs. C. H. Vary of Pomona made a fine showing of brown Leghorns, winning all first and second prizes. Mrs. Vary's brown leghorns are extra good birds, in fact we believe she has as good a flock as can be found in Southern California.

The white and buff leghorn classes brought out some good birds.

The Corn. fowl class contained some of the best birds to be found in America, among them were birds that had won prizes in England's largest shows. This breed is rapidly coming to the front as a fancy and utility breed.

Pomona is coming to be a winner in breeding fancy poultry; her fanciers are eager to learn the fancy points of their respective birds, and are hard workers and careful breeders. We confidently believe in a short time Pomona shows and Pomona birds will be known all over the southwest for hard work and honest dealing is bound to win.

Frank H. Thomas of Los Angeles judged.

Live Stock and Dairy

By Mrs. Minna E. Sherman

RAMBLINGS.

THERE ARE many things that come up day by day on the farm that seem worth writing about that do not fail into line with any one subject. Dad, the engineer, is always interested in telling me to put in this or that; as he somewhat graphically puts it: "Why don't you swap that with t'other fellow." If we would only all tell each other some other things we have found out, the sum of human knowledge would increase more rapidly. Other people's farm or fruit problems are not those of Fresno County, yet the experiences may be no less acceptable of the way we try to make the best of things. This year raisins were largely left on our hands, and the growers who have not large barns or a packing house plant are badly up against it. The tule fogs of the past ten days have penetrated the stacks of raisins on the trays out in the fields. The moisture absorbed is making them soften and mould. While the possibility of having only a few raisins to sell, instead of the large tonnage that has gone into the new combine, is not admitted in the raisin circles, still it is more than a possibility. The demand for pigs for feeding with the raisins is growing, and every one that has shoats of forty or fifty pounds weight is reaping a harvest.

Pigs.

To have a goodly band of pigs on a ranch pays well. The demand comes every year about this time, and it pays better to sell them off at this age than to make hogs of them. The pigs are the natural consumers of the skim milk from the dairy, and can be raised at little cost. Alfalfa forms the basis of their food, and then in the fall the wastes of the packing house, cull grapes, principally, follow as food. Then the pumpkins are ripe and the pigs revel on them. Pumpkins and alfalfa hay, with a good run on Bermuda pasture, will keep the pigs growing thriftily. Dry places or rather those not fouled with dropping into filth, help the pigs to be thrifty. While pigs like a mud wallow in the summer time, in the winter they try to keep as far from water as possible. Exercise they find for themselves in rooting up the Bermuda. They seem to find grubs as well as liking the underground stems of the Bermuda. The Bermuda seems to be the better next season for the thorough overhauling the pigs have given it.

Corrals.

The prices of lumber make board fences and posts for yards rather too expensive. Two large pig yards, however, should be established with suitable styes. The willow trees for post and wire fencing, put a good 10 inches under the ground, will make a suitable fence. The willow posts usually grow, and in time will furnish wood enough to pay for the ground they occupy. We are cutting, for sale, about two hundred cords of wood at present, from willow posts that have grown along the ditches and field fences. The same trees will put on new tops large enough to make worth cutting again in four years.

There should be two distinct places for the pigs, and each place should be used alternately six months at a time. The young male cattle from six to fifteen months old may run in the pig yard and eat of the same foods. In the winter time the pigs will enjoy the silage the calves leave. When the pigs are removed to the other corral the one left vacant is plowed up and sown to grain. The lot the pigs were taken off last spring was put into Indian corn and pumpkins; the pigs harvested this on the ground. The present empty corral will be sown to barley, and in the summer the pigs will be turned in to harvest off. This way gives little trouble to any one, as it is only in the spring months that the pigs require to have a load of green alfalfa thrown to them.

Alfalfa.

After all, the feeding in California's great valley must center around alfalfa. Do you realize how short a time we have recognized its actual value? The dairy people twenty years ago thought it useless to try to feed a milk cow on alfalfa, as the milk was not usable. We have learned differently, and now the East is discovering the value of this plant food. The scientific work of the bacteriologist has made the growing of alfalfa a success wherever there is any plant food available in the soil. It is possible that soil can be too poor to support vegetable life at all. In the growing of alfalfa there were a few farmers that followed the old rules of bringing soil from a good alfalfa field to put on the new land. They had found out by a thousand years of experiments that it was good to do so for clovers, and that alfalfa responded kindly to the same treatment. Why? No one knew! I sometimes wonder if there is not a like scientific reason behind the water witch, and also behind the belief in the sign of the moon for planting of crops.

Scoffers.

Careful gardeners amongst Chinese always plant by the moon. Now, I doubt whether these theories are proven, yet as the moon is their standard of time, naturally they blamed her with all failures. While there is probably nothing in the idea that the fence posts will be pulled out of the ground by the rising moon, or that they will be driven in more securely by the decline of the moon. Yet it would not surprise me to have some Experiment Station send out a bulletin explaining the why and wherefore of this matter. In the days of youthful sureness, I would have laughed at the idea of such a thing. Now as I grow older the respect grows for the stored wisdom of old beliefs and experiences.

Too Slow.

That the farming public is slow to accept new ideas sometimes takes an amusing form. The leading paper of the east, along stock lines, has been gravely assuring its readers that barley may be fed to horses and cows. One man gravely gives as his experience that it may be ground, and when fed with corn and some roughage the calves grow finely on it.—M. E. Sherman.

HAND SEPARATORS.

The farmer or dairyman who handles the milk from five or more cows for profit in butter making or cream selling should own a hand separator.

The hand separator, working under favorable conditions, leaves from 1-50 to 1-20 of a pound of butter fat in 100 pounds of skim milk. The

Be Just As Particular

about your dairy as you are about other things, and then you may expect profitable returns and a large production of cream.

Many farmers who are up-to-date in every other way still cling to primitive methods; either because they don't care, or else because they don't realize that they are losing from 9 to 40 pounds of butter per cow per year.

The best dairy results are obtained by the

Tubular Separator

because it skims to a trace, and delivers a rich, velvety, frothless cream; furthermore, it will last a lifetime, necessitating but few repairs.

The simplicity of the Tubular alone is worthy of your consideration, notwithstanding its many other features.

For full particulars write for catalog 260. Sent free upon request. Send now.

gravity and the dilution (water separator) systems of securing the butter fat, will leave, under the most favorable conditions, from 1-3 to 1-4 of a pound of butter fat to each 100 pounds of skim milk.

The farmer who handles the milk from 10 cows which produce 80,000 pounds of milk per year, should not lose over 40 pounds of butter fat in the separator skim-milk. By the water separator (dilution) or gravity methods there would be a loss of 275 to 600 pounds of butter fat per year. Figuring butter fat at 20 cents a pound, there would be a loss between the hand separator and the other methods of from $45 to $110 a year. Thus the saving in one year would pay for the separator, and it would be good for many more years of service.

Advantages of the Hand Separator.

1. The machine not only secures practically all butter fat, but it delivers the skim milk in a sweet, warm, and undiluted condition ready for the calves or pigs.

2. Less labor and dairy utensils are necessary than with the other systems.

3. The cream is of uniform richness. It has removed much of the fibrous and foreign matter.

4. The milk has had no chance to absorb bad flavors and odors from standing around and the cream is produced in excellent condition.

5. There is a gain in the quality as well as the quantity of the butter obtained.

6. City dairies can improve the quality of their milk very much by running it through the separator and afterwards mix the skim-milk and cream before bottling it. The milk is not only aerated, but many of the impurities are removed, thus making it sweeter and giving it better keeping qualities.

Size of Separator to Buy.

Hand separators may be procured in sizes varying in capacity from 150 pounds of milk (18 gallons) an hour to 1200 pounds (144 gallons) an hour. The prices vary from about $40 for the smaller size, to $175 for the larger size.

The capacity of the machine per hour should not be less than 50 pounds for each cow milked. A 10-cow herd would then require a 500-pound capacity separator, and an 18-cow herd, a 900-pound capacity.

Make of Separators to Buy.

There are many makes of good separators now found on the market which are sold as cheaply as many of the poorer ones:

1. Buy a Standard machine—one that has a good recommendation and is known to be durable and reliable.

2. Don't buy the average "Catalogue house" machines. They often do good work, but as a rule do not last long enough. Many of them are cheap in construction as well as in price.

3. Buy a well known machine—one that is guaranteed in construction, material and clean skimming.

4. Secure the machine from a "near by" reliable agency.—H. M. Bainer, Professor of Farm Mechanics, Colorado Agricultural College.

Tehama Live Stock Association met at Red Bluff recently and urged that a strong position be taken to prevent ranging of stock in public highways.

Nearly four inches of rain have fallen in many parts of Sacramento valley during the season.

THE "ELECTION" RESULT THAT CONCERNED SEPARATOR MAKERS

It wasn't the "dire calamity" of the possible election of Bryan which caused the Pennsylvania manufacturer of "jobbing" cream separators to "warn" his employes to parade and vote for Taft—in a State with nearly half a million Republican majority.

It wasn't the hope of Bryan's election which caused the "Iowa" manufacturer of "mail order" cream separators to offer to take on all the employes the other man might let go—because he was already laying off and cutting down the working hours of his own men.

The ELECTION which actually concerned them both and which had ALREADY taken place and had ALREADY worked "dire calamity" to their separator ambitions—"mail order" and "jobbing" alike—was the overwhelming tidal wave ELECTION on the part of 1908 cream separator buyers to choose the IMPROVED DE LAVAL CREAM SEPARATORS, regardless of the claimed "cheapness" of one and the red paint and "talking points" of the other.

And now the makers of both "mail order" and "jobbing" cream separators are assured that it's a case of at least "FOUR YEARS MORE" for the old DE LAVAL in its newer-and-better-than-ever form, on top of its previous THIRTY YEARS of originality and leadership.

INDEX TO VOLUME THIRTY-ONE.

By turning to the last pages of this issue of the Cultivator, the index to the present volume may be found. For some time the Cultivator was published without having this value of an index at the end of each volume. Because of this, the greatest good of the paper was lost. For the past few years we have found subscribers showing an increased interest in filing and preserving copies of the paper. This is because of the added value given by the index. Those who have not formed the habit of filing away the Cultivator will find it an excellent habit to form.

By the way, have our subscribers ever thought of the fund of information which is contained in the fifty-two numbers of the Cultivator which make up the two volumes of each year? In fact, we might right here add that this year's volume contains fifty-three numbers, a feature which will probably not occur again in a great many years. These fifty-three numbers containing between thirteen and fourteen hundred pages are largely made up of good live matter written by practical workers in California conditions. No book containing that number of pages of reading matter could be bought without paying many times the subscription price of the Cultivator.

We are trying to make each volume better than its predecessor and to that end if subscribers will send in their experiences and aid us in making known the worth of the Cultivator it may attain a greater circulation, and strength may be added and a greater fund of information given to every one of our increasing family of subscribers.

CO-OPERATIVE EFFORT DIFFICULT.

In an account of a meeting called by the farmers of Gridley, the Herald of that place recently closed the account with the words: "On account of the fact that not enough of the farmers of the region were represented, it was thought best not to proceed at once to organize." There is nothing at all strange in such a statement. In fact, that it is not, is to be regretted. Too often just such a condition prevails. Not enough farmers come out to consider matters of vital interest to them to make the effort win success. Conventions or meetings held to discuss cultural methods, usually meet with the same treatment on the part of the farmers, but that is not a matter of such vital importance, at least we feel that it is not at this time, as the question of marketing, or disposal of that which our ranches will produce. That thought was expressed in the recent state convention held in Sacramento. "Perhaps we need more information as to cultural matters, but our greatest need now is to dispose of what we are already growing."

The only step left open for the meeting recently held in Gridley was to appoint a committee to act as a promoter of the enterprise, which concerned only the farmers. We do not personally know a single farmer in Gridley, but we think we may safely say that many of the farmers approached by the committee which was appointed, treated the proposal of the committee with skepticism and put up the claim that any effort to cooperate would result in failure, and the manager would secure the greatest benefits, and other excuses of like nature. Our farmers should realize the necessity of such movements and aid instead of hindering the committee who in a public spirited way take up the matter of public benefit. We trust the next meeting called by our Gridley friends will be much more successful.

DRY FARMING CONGRESS.

The Third Trans-Missouri Dry Farming Congress will be held in Cheyenne, Wyoming, February 23-24-25. The Congress convenes to discuss and compare methods by which the great area of arid land can profitably be utilized under thorough tillage by which natural rainfall can be conserved. Also to encourage better methods in all districts where rainfall is slight or irrigation water limited. Plans for carrying on educational propaganda by which the arid districts of the world may be populated will also be discussed. Legislation and increased Federal appropriation to aid in this work will also be a feature of the meeting.

One feature of the Congress will be an exhibit of dry farming implements, also of photographs showing methods of work in all parts of the country.

The first Congress held by this body was in Denver in January 1906.

RENDER UNTO CAESAR.

The discussion of the tariff question before the committee at Washington has been the occasion of some little warmth between importers and growers and manufacturers of this country. This has been especially true in regard to fruits in which California is interested. The importer has used every possible argument and it is plainly charged that his statements have not all been perfectly true. This is shown by the manner in which the article, written by G. Harold Powell, Pomologist in charge of fruit transportation and storage investigations, and reprinted in the last year book of the department, has been misinterpreted. This article makes no statement whatever that should be used to the disadvantage of the California citrus industry. Yet the wrong interpretation which has been placed upon it by the importers and accepted by some papers even in California as statements by the Department may possibly have caused prejudice against this particular bureau of the department of agriculture.

It is unfortunate that the attitude which Dr. Wiley has taken regarding our fruit industry is such that fruit growers are quick to believe aught that is charged against the department and its work. But those who watched the results of the magnificent work done by Mr. Powell and his corps of assistants in California, which could not be repaid by millions of dollars, know that Mr. Powell and his co-workers have only good will for the industry. The report which he made in the year book was written in co-operation with the most distinguished growers and shippers in California and was only to attract attention to this magnificent industry.

Further proof of the interest in the lemon is shown in the fact that the department is now contemplating extensive work along the line of lemons similar to that done with oranges. This work should not be hampered and we do not believe it will be, for we believe the citrus growers are too intelligent a class of people to be influenced against this strong arm which is extended to help the industry. When Mr. Powell returns to take up his work, we trust he will find warmest greetings from the citrus industry which has not been influenced against him by false claims of importers who would take any steps to injure California.

PASS THE DAVIS BILL.

The Davis Bill which failed to secure sufficient number of votes to pass at the last session of the National Congress has secured new friends and will reach its passage it is hoped in the present Congress. This bill provides for instruction to be given in home and agricultural economics in agricultural high schools and provides an appropriation which shall begin July 1, 1911 to aid in the work. The Secretary of Agriculture is instructed to estimate to Congress the allotments to be made to each state and territory and to designate to the Secretary of the Treasury the sum appropriated.

The great argument which has been made against this bill is that it smacks of paternalism and that our national government should be engaged in government and not in education. But when it is considered that for every dollar now spent to encourage agriculture and to increase our agricultural output $20 goes into the army and navy, we think the agricultural class is justified in being very insistent on recognition for this measure. There seems no hesitancy in educating the young of the country in the arts of war. That does not seem to smack of paternalism.

INCREASE OF FARM PRODUCTS.

Considering the agricultural productions of the United States for the year 1899, as being represented by 100, the year 1908 shows a production of 165, a very satisfactory gain for the nine years. To give an idea of the gradual increase, we may say that the year 1903 is represented by 125, 1904 by 131; '05, 134; '06, 143; '07, 159; and '08 by 165. At this rate of increase it will be but a short time until our agricultural products will show an increase of over 100 per cent. In the same number of years the mineral products claim an increase of 100 per cent but yet the difference is vastly in favor of the farm for the reason that its productiveness is increased while the increased production of the minerals is not permanent but only a step toward the industry ultimately being extinguished.

Shop Talk

DATES OF EXPIRATION.

This is the last issue of the Cultivator in the good old year 1908. Many subscriptions expire with this issue, and just as a reminder we suggest that subscriptions for the coming new year be forwarded promptly. This is the most convenient time of year to attend to renewals and it is most satisfactory to make payment in advance. If the figures on your address label are 1-09 the best way to start the new year will be to send in your dollar.

And let us ask, where could it be placed to bring such valuable return as in fifty-two issues of the Cultivator? Also owing to the fact that so many readers keep files of every issue we do not discontinue mailing unless we get orders to that effect, so please bear in mind that it is necessary to drop us a card if the paper is not wanted.

We would also suggest our recent clubbing offer by which the leading periodicals can be obtained with the Cultivator at greatly reduced rates. If interested in this drop us a card for clubbing price list.

Agricultural Notes of the Pacific Coast

Northern California

Mushroom hunters have been busy on the hillsides of Newcastle, Placer county, since the recent rains.

Farmers at various institutes have endorsed and encouraged the work of the State High School at Davis.

Progressive Grange at Healdsburg, Sonoma county, will install new officers for the coming year January 9.

The Encalyptus Timber Company of California was recently organized at Petaluma with a capital stock of $100,000.

Eastern capital is aiding in the reclamation of lands along the American river by building levees to keep out spring floods.

The Northern California Bee Keepers' Association held its third annual convention at Pioneer Hall, Sacramento, Dec. 21-22.

Sutter county farmers are appealing for "a white man's country for the white man," owing to the influx of Japs in that section.

Wild horses in the mountains of Trinity county are becoming so plentiful that their depredations are causing much loss to some stockmen.

The Sacramento Valley Eucalyptus Company is the latest enthusiastic move for eucalyptus planting. It is organized by business men of Sacramento.

A force of men and teams at work on Reclamation District Number 730 in Yolo county has completed repair work on some of the levees for that district.

A couple of large gun clubs will be ousted from possession of a vast quantity of waste land in Sutter county by the large reclamation scheme now under way.

At the recent annual meeting of the directors of the Dixon Creamery the report of the secretary showed an increase in business over previous years of about $10,000.

A meeting of the Sacramento Valley Development Association was held in Sacramento recently and discussed the drainage problems of the lower part of the valley.

A recent meeting of the farmers at Yuba City has urged that a much higher grade of fruit and better method of packing should prevail during the coming season.

A shipment of prune trees from Oregon to Chico was condemned by Horticultural Commissioner Stiles because of root borers, and later the trees were returned to point of shipment.

Gridley has formed a vegetable and fruit growers' association, the purpose of which is to buy, sell and deal in vegetables. As a matter of fact, however, the real mission is co-operative marketing of products of the members.

Petaluma Grange Patrons of Husbandry elected officers for the coming year as follows: Master, D. M. Winans; overseer, George Meissner; lecturer, Mrs. Alma Walls; steward, Mrs. Mary E. Hall; assistant steward, M. D. Hopkins; chaplain, Mrs. Eliza Grover; treasurer, Mrs. E. G. Bennett; gate keeper, Wm. Dent; ceres, Mrs. J. Skiffington; secretary, Miss Cassie McGlynn.

Central California

Lodi recently sent eight cars of wine to New York in one day.

There are 625 acres of strawberries and other small fruits bearing in Santa Cruz county.

Apple buyers are engaged in picking up the small, straggling lots of apples still remaining in the Pajaro Valley.

A Fresno fig packer maintains that fig growers do not prune their trees sufficiently to get a satisfactory crop.

Over 20 car loads of fruit are already guaranteed for another apple show to be held at Spokane next year.

The recent poultry show at Hanford was one of the largest ever held by that association, and a showing of excellent birds was made.

Practically all the oranges of Lindsay have been shipped and the packing houses are closed. There will be smaller fruit shipped later in January.

The recent cold snap extended all through Central California, ranging from as low as 18 degrees in some very cold sections up to the freezing point.

The beet acreage of the Pajaro Valley will be greatly increased the coming season. It is predicted that the acreage of last year will be more than doubled.

The manager of the Modesto cannery has issued a circular urging the immediate spraying of fruit trees for curl leaf, shot hole fungus, scab, worms and moth.

Many fruit growers are greatly concerned over the work of the little pests of thrips. It seems to be almost impossible to find any effective treatment for this mite of an insect.

The orange growers of Lindsay in a recent mass meeting protested against the proposed tariff reduction on citrus fruit. The action was sent to Congresman Needham in a telegram.

As an indication of the development which has followed irrigation in Stanislaus county, it is reported that in 1899 the fees of the county recorder's office were under $2,000, while for the 12 months of the current year they have already aggregated $5,520.

The apiarists of Fresno county held an institute in Fresno recently, which was in charge of Prof. Ralph Benton of the University of California. Mr. Benton reported the honey industry of California to represent a capital of $2,100,000.

The raisin committee is continuing its work, and hopes to be in full control of the situation in a short time. The plan of organization of this body of fruit growers is more nearly on the line of the California Fruit Growers' Exchange than any the raisin growers have ever tried.

A co-operative fruit marketing organization has been organized for the purpose of handling dried fruit, especially raisins, of the members of the organization. The officers are: H. V. Rudy, president; B. E. Hutchinson, vice-president; Frank Frisbee, secretary. Directors, Frank Giannini, John McBriar of Reedley, Ed Thompson of Sultana, William Swall of Visalia, A. R. Nicholson of Oleander, and Dr. G. A. Hare of Fresno. Every stockholder must be a bona fide fruit grower.

Southern California

The Hughes Packing House at Orange is running full force on lemons.

The Riverside marmalade factory is already started on the coming year's pack.

Several sales of citrus land have been made to newcomers at San Fernando.

California Vegetable Union has advanced the price on celery in New York to 35 cents per bunch.

The first Imperial county fair is reported to have made good, and to have greatly pleased all those concerned in it.

Nearly all orange sections report that as time passes it is apparent that the damage from frost will be very slight.

Manager Hille of the San Fernando Fruit Growers' Association reports oranges and lemons in fine condition and a good crop for this year.

A movement is on foot to purchase the land now used in the Citrus Experiment Station at Riverside. This at present is controlled under lease.

The recent opening of the Imperial Valley Collegiate Institute at Heber was very successful, and is regarded with favor by all residents of the valley.

Celery men who shipped their celery in November received from 16 to 26 cents. The shipments at the present time are commanding from 21 to 31 cents.

A packing house, the third to be erected at Hemet, is about finished. It is 68 by 80 feet. It will be opened for the shipping of fruit after the first of the year.

Walnut growers of Southern California are more or less concerned in the work of the tariff commission and query is often heard as to treatment which will be given to walnuts.

The Riverside Citrus Experiment Station is improving the quality of citrus fruits by selection of variations and the finest fruits of which they can learn. It is hoped in time to develop a distinctly improved Washington navel.

Imperial Valley land owners are elated over the acceptance of the survey, and it is assured now that subdivision of some of the larger bodies of land will be made and encouragement offered to settlers on small tracts.

The manager of the San Fernando Fruit Growers' Association reports that the association will be much stronger this year than ever before, several sales of real estate having been made which transfer large orchards to the association.

Seventy carloads of oranges is the estimated crop for Hemet this year. The orange land lies to the southeast of town, and in Valle Vista, about five hundred acres in all, many of them young orchards. The orchards are in fine condition, and will yield the best quality of fruit.

Walnut growers of Southern California are endeavoring to find a reason for the apparent glut of walnuts. The production is barely above normal, and should have been taken without any remaining in the California storehouses at this time. Some think it is because of large dealers wishing to control the market.

The Coast

Alfalfa hay is selling in Tacoma at $15 per ton.

The National Stock Show will be held in Denver January 18-23.

Hood River, Ore., is making a display of apples in New York City.

One shipper of Spokane has shipped 70 cars of apples to Europe the past season.

Pendleton, Ore., is making a fierce war on coyotes, which are proving a serious pest.

One Colorado asparagus grower secured $604 from the product of one acre last season.

Seattle, Wash., recently reduced a large surplus of eggs by making a shipment to Alaska.

The grange at Lents, Oregon, now numbers 170, and is building a $6,000 concrete grange hall.

The receipts of the State Agricultural Fair of Oregon have more than doubled in the last four years.

Spokane has been selected as the next place of meeting for the National Horticultural Congress in 1910.

Owing to unsanitary conditions, the State Health Commission has closed a dairy at Bellingham, Washington.

Montana farmers are endeavoring to secure Chinese labor to take the place of unsatisfactory labor now employed.

The Washington Live Stock Association postponed its meeting, which will now be held January 8-9 at Spokane.

Many large tracts of land in the Willamette valley have been surveyed and will be subdivided early this season.

The cantaloupe crop of Colorado the last season proved on the whole successful, some growers netting $175 per acre.

Fourth annual meeting of the Washington Grain Growers' Association was held at Pullman, Washington, December 9-11.

Polk county, Oregon, recently closed a successful poultry breeders' fair. About 400 birds of high quality were exhibited.

One of the greatest industries in Mexico which is now growing faster than any other agricultural industry is that of sugar cane.

A plan is under way by which several thousand acres of rich land in Klickitat county, Washington, will be brought under irrigation.

Stockmen of Salem, Ore., have pledged $1500 for salary and expenses of an expert who will test cows and instruct dairymen in the tuberculin test.

Feeding live stock has become a great industry at Kendrick Idaho. The farmers now prefer to feed their grain and sell it on the hoof rather than to ship and sell as formerly.

One London buyer of apples recently secured a full car of premium winning fruit at the National Apple Show at Spokane and shipped to London. The car across the country was covered with banners proclaiming its contents.

The Pacific Farmers' Union is the name of the new paper which will be started at Pullman, Wash., January 1. It is under the auspices of the Farmers' Educational and Co-operative Union, and is to be the representative of those organizations in Washington, Oregon and Idaho.

Don't Forget Quality

MIDLAND Poultry Food

Is based on ***quality*** and it is quality in Poultry Food that produces eggs. ***Cheap filler*** and ***cheap grain*** will ***not*** make eggs. ***Midland Poultry Food*** contains only the ***choicest*** cereals and animal food the market affords. Trap Nested White Leghorns

I trap nest every bird one year before I put them in my breeding yards. and no bird that has not made a record of 13 dozen or better per year as pullet is used. I cannot afford to breed neither can I afford to sell eggs from a hen that has not made this record as a pullet. I mate 15 hens to a well matured cockerel or yearling cock bird. My breeders have roomy yards, thus assuring strong fertility. A few choice cockerels for sale.

Eggs $1.50 per 15; $7.50 per 100; $60 per 1000.

S. E. Gregg East Adams St. Riverside, Cal.

White Wyandottes

My San Jose Winnings: 1st, 2nd and 3rd Cock; 1st Cockerel; 1st, 2nd and 3rd Hen; 1st and 2nd Pullet. The above winnings were made out of ten entries.

Box 60, R. No. 1 Mrs. C. D. Hubbard San Fernando, Cal.

Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

POULTRY PROFITS.

THE Cultivator has received a long communication, or circular, it now appears, for we note that it has been printed in another paper, in which great profits are chronicled.

The poultry business in California has been very profitable to many, but it surely demands the keenest of judgment, hard work and attention to details. The easy claims to easy money may be to the disadvantage of some looking for an occupation, so the circular was referred to Mrs. Metcalf, who writes:

The writer claims that only a few hundreds of dollars are needed to start in the poultry business here, and cites a case in point. Now, to publish this letter might induce some one who is making a fair success in some other line of business to give up his certain income for a new venture and prove his undoing, for this country as well as the whole United States is full of abandoned chicken farms.

GOLDSMITH MAID.
First Prize White Leghorn Hen at San Jose and Petaluma, 1908. Owned by Frank E. Baldwin, San Jose.

This report gives the income as $1981 from 500 hens for one year. Let us try and figure out the profits before we leave the desk or shop to go into chickens. Te begin with, the hens themselves must have cost at least $1.00 each, and when marketed would bring about 50 cents each as markets go, but as they reproduced themselves perhaps that had best not be counted, although it certainly cost something to raise the pullets. To feed 500 hens and 1000 youngsters would cost a pretty penny, as I have found by years of experience, and $1.25 per head is none too much for the feed of the mature birds, each, one year. That would take $625 of his profits at a lump. The cost of raising 1000 young birds, and it would take 1000 to replace the 500 hens, you see, would not be less than $350 for feed, which would bring the cost up to $975 at the very least calculation. The eggs which didn't hatch are also a loss, although usually accounted a small one, and he surely must have had some chicks die. To raise 1000 chicks in one flock is a sad mistake, and this is the very first successful case I have ever heard of. Fifty in a flock are considered the best number, which requires more brooder room and more time to care for them.

Poultry is profitable, but to get an intelligent idea of any experiment we want the cost of the feed, the capital invested in buildings and appliances, and losses sustained by chicks dying or being killed by accident, before we can judge whether it was a successful business or not.

It is so hard to get at the real facts of a case like this. Figures are the very worst liars on earth. Why a man back east made $3000 on a farm, actual money, besides paying a manager $1000 a year, and buying expensive tools and stock—by sitting in his office and figuring it all out on a paper. He counted how many heads of cabbage could be grown on an acre, how many dozens of ears of corn, how many onions, potatoes, etc., and wondered why he had been pegging away at law all those years, only getting a paltry judge's salary when he might have been a millionaire farmer all this time.

He invested in a farm, hired his $1000 a year overseer, paid out all the money he had earned on the bench, and went bankrupt in three years. I don't know why, when figures showed him so conclusively how it could be done, but certain it is, his cabbages didn't pan out, neither did the other stuff, and failure was his portion.

Another man I knew of had a good job bookkeeping. He had a legacy of $4000 and figured out on his desk how much money could be made in chickens. Figures don't lie, he thought, so the way his profits multiplied the way he figured made him sick of his salary, and with his four thousand dollars he started in to scoop the poultry business, with a brand new, equally inexperienced wife. He bought a 14-acre ranch, with small house and barn, near a beautiful Ohio town, for $2100, and then proceeded to put up a $1300 hen house away back at the end of his farm. Poultry men who came to our place used to laugh and wonder if he meant to keep an automobile to run back and gather the eggs or do off a room or two and live in one end of it. He bought a 360-egg incubator and some high-priced eggs and set to work to fill that big building. I tried to advise him, as did other old hands at the business, but there was no use, he knew it all. He read all the books, and our experience was old-fashioned and out of date. Well, his eggs didn't hatch

Cornish (Indian) Fowl

The bird for fancy and utility. If you want the best, I can furnish them, winners at England's and America's greatest shows. Eggs from my grand double-laced, low, blocky, imported birds, $5.00, $7.50 and $10.00 per setting. Pen headed by best cockerel bred from my imported birds, mated to American bred hens, $2.50 per sitting. Young stock for breeding and exhibition a matter of correspondence.

Remember, my imported stock is the best Brent could produce, are extra large, true to shape and color. Winners of all firsts at Los Angeles, 1907-08. Clean sweep at San Jose, 1908. Send for catalogue.

very well and the chicks didn't conform to his ideas of early hours, for about 8 o'clock he would go out and release them from the hot brooders and feed and water them, and let them grow or die, as they saw fit. And they certainly did see fit to die in alarming numbers, for those close, hot brooders were never cleaned properly, and those that did live were scrubs. In one year he had sunk his pile, and the place was mortgaged for all it was worth. Now, that was in Ohio, and like failures are as common as can be back east, so don't think California is an exception, only as more people are coming here looking for a soft snap than any place on earth, more failures are noted, on that account, and the legitimate chicken business gets a black eye it does not deserve.

Some times I feel like telling people that poultry is like poetry, and that a person can make a living and raise chickens, by working just as hard—at something else. Yes, that's it, work at something else, until you are certain that you have mastered the chicken business. It is just as hard to learn as any other business, and the profits are just reasonable, year in and year out. Business men who make 30 per cent. on their investments are scarce, and many of them work with all the energy they possess for much less, in addition to the capital invested. So don't rush rashly into the chicken business, but try a few hens and see how they pay, then add or reduce as the outcome pans out.—Mrs. Frank Metcalf.

Now, we trust no Cultivator reader will rush off and say that Mrs. Metcalf is "knocking" the poultry business. Quite the reverse, for the person who goes into it with eyes open and knowledge of its drawbacks is more surely a stayer than one who starts on the impulse and with enthusiasm that great profits will be secured. Only harm can come from too inflated ideas.—Ed.

BLINDNESS AMONG CHICKENS.

The most general cause of blindness in chickens is an infection caused by atmospheric conditions, says "Tribune Farmer." It is a disease allied to pink-eye in horses, and will run its course in spite of any remedy that can be used in an organ as delicate as the eye. It is an alleviating treatment which must be used rather than a curative one. Perhaps no better one can be used than a mixture of boracic acid, one dram dissolved in four ounces of water, and two ounces of Pond's extract of witch hazel. Sop the eyes with this twice or more daily. In a very bad case, use a drop or two of pure olive oil in the eye. Feed quite largely on mash food for a time, or until the eyes clear up. When the bird is totally blind—as will sometimes occur—then it must be fed from a spoon by opening the mouth and dropping the food in. It must always be kept in mind that clean henhouses, good sanitation and nursing the ailing bird are more essential by far than drugs in heading off the disease.

Goslings should be kept out of bathing water until they have a full coat of feathers. Young ducks intended for market should be kept away from pond or stream. They enjoy swimming but it toughens them and checks their growth. A good fattening ration that the young ducks relish is made from yellow cornmeal. See that they get green food if penned. They are very fond of lettuce.

BABIES FOR SALE

NINETEEN kinds of baby chicks, turkeys, ducklings, goslings, etc. Send for our price list, gives full details and information. We ship chicks safely anywhere within 48 hours, no loss. We know how to hatch and pack chicks for shipment. We are booking orders now. Place your order early and be sure then to get exactly what you want. Can supply chicks in lots of 1 dozen to 30,000 every 21 days. Write us today. Visitors always welcome.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Uusigned communications receive no attention.

Antlers Each Year.

May I ask if the oft repeated statement that a deer loses its antlers each year is a fact?—Appreciative Subscriber, Crows Landing.

It is a fact, and an extra prong comes with each new year's growth. The old horns are lost in the spring time, new ones coming on in May or June. They attain full growth usually by the middle of July when they are "in the velvet." They are not thoroughly hardened sometimes until the middle of September or even October.

Belgian Hares.

Where can I get Belgian hares and how are they fed and cared for? Should the males and females be allowed in the same pen? Will they do well if allowed to run loose?—J. L. R., Laton.

This question has been referred to a subscriber in the northern part of the state who has experience and is qualified to answer and will be answered in these columns as soon as returned. The sexes should be kept separate and they will not usually live long if turned loose.

Chrysanthemums.

Please tell me how and when to plant chrysanthemums and where may I get a good variety?—W. S. M., Santa Paula.

Chrysanthemum plants may be secured in season which is about April or May. That is, that is the time of dividing the old plant or of setting out the rootings made from little slips. They may be secured from any nurseryman usually; at least the nurserymen and seed houses advertising in the Cultivator can supply you. The culture is very simple and full instructions will be given in the Ornamental Garden Department in the next few weeks.

Plants from Florida.

Is there a law or restriction against having sweet potato plants sent to me from Florida? There is a certain kind grown there which I wish to try this coming season.—Subscriber, Chino.

The quarantine against all plants from Florida would prevent your receiving sweet potato or any other living plant from that state. This is because of the white fly which infests that section and to attempt to bring any plant from there would be nothing short of criminal. It might cause loss of many thousands of dollars to your community.

Budding.

How can I tell when is the proper time to bud, and how are the buds prepared? What is the best graft for walnuts? Is there any special treatment of scions?—Subscriber, San Luis Obispo.

The question is rather indefinite to give an intelligent answer, but in general we may say that with any tree the proper time of budding is when the bark will slip easily, so that the bud may be shoved in when the slit is made. With the orange the early spring growth, say in April, is favorable, and some prefer the fall budding, which occurs usually in September, before the sap stops flowing. The walnut is usually grafted, which is done in the springtime, when the sap first starts and before the leaf is out. The only special treatment for the scions is that they shall be taken while still dormant, and may be packed in wet sand to keep until the stock is in proper condition, which may be determined by the appearance of the tree, the swelling of buds, etc. As to what is the best graft, if by that you mean the age of the wood, there is difference of opinion, some maintaining that one-year-old wood is best. But regarding the wood, Mr. Neff of Anaheim says: "The scions should always be of solid, mature wood, that is, with as small pith as can be had readily and must have good living buds. Each scion should be about one-quarter of an inch in diameter, and should have two buds. The growth having buds close together is best, as shorter scions can be used."

More explicit directions for grafting, also budding, with illustrations, may be had in Wickson's California Fruits.

Varieties of Fruit.

Will you be kind enough to give an old subscriber a list of the best variety of each kind of fruit trees in this locality? Would like from earliest to the latest peaches, apples, apricots, cherries, pears, plums, prunes, nectarines and almonds. Will almonds do well planted singly, also walnuts? Also best grapes for raisins and table. Can sell surplus at cannery. We feel that your paper is an old friend so go to it with these questions. Do thin shelled walnuts come true from the seed or should they be budded or grafted?—Old Subscriber, Kern City.

It would require practically the reprinting of a nursery catalogue to give our subscriber all the information he asks and as he asks it. The first consideration is what will your local market take from you at a good price? You say the cannery will take the surplus fruit, hence the cannery should be consulted as to varieties which they will purchase. Bear in mind that in some fruits, for instance peaches, lemon clings and one or two free stones are favorites while others will not be taken at any price. Your cannery can give you information along that line. For this column to give earliest to the latest of all varieties you mention would require too much space. And in that your own locality can give you a better answer than any one at a distance; for instance apples. If you are in Watsonville you find all the apple growers recommending the Newton Pippin or the Bellflower. In your vicinity we imagine the earlier or summer apples would be preferable.

In cherries would plant very sparingly for we never have heard of cherries having been a particular success near Kern City. With almonds, unless you are fairly free from late spring frosts, we would also plant very sparingly. Walnuts may be planted singly for, while the blossoms are separate the staminate and pistillate both occur on the same tree.

The almond proves the better bearer by cross pollination, that is the planting of different varieties. The soft shell especially is deficient in pollen and will not bear well if planted alone. Neither thin shelled walnuts nor any other come true to the seed as a rule. Formerly it was thought that such would be the case. But now, as we recently heard one grower express it, he would as soon think of planting a seedling apple as a seedling walnut. This is an extreme view but indicates that budding or grafting the walnut insures best results. A nursery catalogue from a good nurseryman, or better, conversation with one who is conversant with your climatic and soil conditions will be of much more value to you than general information from this distance.

Removing Warts.

I notice article on page 587 of December 17th issue of the Cultivator, on "Warts on Cows' Teats," where the knife or acid is recommended for their removal. I consider this all wrong. Take the troublesome part between the thumb and forefinger, and with a quick twitch jerk it out by the roots, for it will come out that way. It will disturb the cow so little that I have had cows merely switch their tails, but most cows had better be tied up during the operation. Remove all the warts that are large enough to get hold of, rub a little salve on the teat, and in a day or two all traces of the warts will be gone. If they ever grow out again, repeat the operation. It is so simple that no other method will be used after trying once, and it is a mercy to the animal to remove them. One milking with sore teats will cause the cow more pain than removing a dozen warts. This is not theory, but a knowledge learned by actual practice.—W. H. Shafer, Selma.

Pecans.

Can you inform me whether the pecan will succeed in this locality? Soil is sediment or river bottom formation, in a section where frost makes orange growing risky. What profit may be reasonably expected? Where may trees be obtained?—W., Riverside.

While the pecan has been grown for many years in California it has not yet proven satisfactory enough to win extensive planting. We know of no successful orchard, although there have been individual trees that have born good crops. If you have sufficient moisture we should think you would prefer the walnut in your section. Trees may be had of any of the nurserymen advertising in the Cultivator.

Alfalfa in Walnut Orchard.

I would like to take advantage of your kindness to inquire whether or not it will be detrimental to the growth of young walnut trees to grow alfalfa between the trees?—Reader, Los Angeles.

Growing alfalfa between the rows in a young walnut orchard is not detrimental provided the alfalfa always has sufficient water to keep it in a thrifty, growing condition. The danger lies in allowing the land to become too dry and in this way checking the growth of the trees. Alfalfa is a nitrogen-gathering plant, and in this way benefits the land even when the crop is taken off the land and its root system is very large and humus will be formed by the decaying roots when the alfalfa is no longer profitable because of shade from the trees.

You can, however, improve your land faster and at the same time get some income by growing a crop of corn between the trees, then sow peas as soon as the corn can be gathered; plow the peas under in March and plant corn again, always planting the corn as early as can be done to escape late frosts. If the corn is kept well watered the trees will need but one additional watering after the corn is matured.

Vines for Hot Location.

What vines (roses or perennials) are adapted for the eastern side of a porch where the thermometer registers 110 degrees in the summer? Do you know anything about the Sipho, or Dutchman's Pipe? Will it endure the frost? I sowed seeds twice and they did not come up.—Northern California.

Few roses will thrive in a situation where the heat is so intense. Beauty of Glazenwood or Climbing Kaiserin Augusta might. Many roses will endure 110 degrees out in the open that will fail when trained against a building where they must endure the addition of reflected heat. Almost any of the Jasmine family would do, and some of them are deliciously fragrant. Some of the honeysuckles are good—notably Lonicera Halleana. Aristolochia Sipho grows throughout the entire South, and is a splendid climber and is classed as hardy in semi-tropic countries. It is easily grown from seed, but it is usually more satisfactory to buy all such plants from your local florist, grown in pots.—Q. A. L.

Potatoes at Rialto.

I am thinking of planting potatoes in the spring. My soil is light, sandy loam. Before I plant, I would like to know if any kind will pay to plant in such soil, and what kind is the best for sandy loam.—W. B., Rialto.

From observation during several trips through your locality, I would not consider you had soil that would be profitable for potato growing. Your particular tract may be an exception, and it is extremely difficult to pass an intelligent judgment without seeing the land. Sandy loam is all right if not too light, and not too poor and lacking in humus. Ascertain if you can, from your neighbors, if they have tried potatoes on land such as yours, and if so you can be helped in your decision by their testimony. You do not say whether you intend to grow for market or simply for your own use. If for market, I should not deem it wise to do so on a large scale until you had given the matter a test or had the evidence in your favor from your own locality. The White Rose is a good variety to yield and sells well because of its fine appearance. Salinas and Lompocs, as they are known in the Los Angeles market, are good and practically the same, only coming from different localities.—Q. A. L.

Canning Olives.

Kindly give information as to best method for canning olives. Is the tin can as good as the Mason glass can, if thoroughly sealed?—E. J. G., San Bernardino.

The olive is usually canned in tins and as put up commercially seems to keep just as well as in glass. It has one advantage that light is kept from the fruit until it is opened. When opened it should be removed from the tin at once. The method of canning is much the same as the cannery method of canning fruit.

The olives are cured in the ordinary way and the last brine is not made so strong as where they are to be kept in an open tub as it has not been found necessary to make the brine any stronger than is agreeable to the taste. The olives are placed in the cans, brine of the required strength poured over, then all placed in a boiler or other vessel with water surrounding the cans. Care must be taken to place the cans, especially if of glass, up from the bottom by laying

EUCALYPTUS SEED

Eucalyptus rostrata, the Red Gum
E. corynocalyx, the Sugar Gum
E. tereticornis, the Forest Red Gum
E. globulus, the Blue Gum
E. citriodora, Lemon-Scented Gum
E. cornuta, the Yate Tree
E. polyanthema, the Red Box
E. leucoxylon, Victorian Iron Bark
and Many Other Valuable Sorts

I shall be pleased to correspond with prospective buyers and give particulars as to prices on the seeds I am offering. Trial packets of any variety 15c each, 2 for 25c, or twelve for $1.25. Also young trees of many varieties for sale. Send for circular and cultural directions.

wood strips underneath. Heat the cans to 175 degrees and hold at that temperature until all fruit is thoroughly heated through. If 175 degree temperature is not exceeded the flavor will not be injured in the least. Seal and store in the dark.

Legal Queries

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Statute of Limitations.

In 1890 a tract of land was cut up into smaller tracts and sold. The owner of the tract had the boundary lines surveyed and, at his expense, constructed irrigating ditches on these boundary lines. Purchasers of the sub-divisions accepted all boundary lines without question, and planted vines and trees, built fences and farmed the land accordingly. In 1902 another survey was made of a part of the tract, and from this it appeared the original lines were not correctly placed. No advantage was taken of this survey, however. A more recent owner of one of the smaller tracts who would be benefited by the 1902 survey is now claiming that owners should accept the 1902 survey, and move fences and ditches accordingly. Would he have any legal right to force his contention? Are not his claims outlawed?—Owner.

When owners of adjoining lands have acquiesced for considerable time in location of division line between their lands, although it may not be true line according to calls of their deeds, they are thereafter precluded from saying that it is not true line. The better opinion is that considerable time mentioned in cases must at least equal length of time prescribed by Statute of Limitations to bar right of entry.

In your particular case, all of the parties having had knowledge of the survey of 1902 and of the fact that the prior survey was not correct, and that the original lines were not correctly placed, and having acquiesced for a period of five years would be estopped from asserting any different lines as the boundary lines.—Edw. L. Payne.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Please address all questions that are to receive gratuitous replies through these columns to California Cultivator, 115½ N. Broadway.

All communications to Dr. Whittlesey direct should contain a great big dollar.

Heaves.

I have a fine large horse. He seems to be in good health, eats well and works fine, but he has a cough mostly of a night. Some say he has the heaves, but he don't show any signs of snortness of breath when working or pulling a heavy load. Please tell me what to do for him, and oblige. Yours respectfully, T. C. H.

There appears to be a difference of opinion about your horse, even among the people who have examined him. Horses cough from various causes, and a cough in itself is not a very sure sign of any particular disease. There is a peculiarity in the cough and breathing in heaves which it is impossible to describe in print. A steaming of his head (inhalation) for an hour once daily with a solution of eucamphol and water, two ounces to one gallon, would be the treatment in my hospital.

Thrush.

Whaat is best to do for thrush in a horse's foot? Also can "contracted heels" be cured or not?—W. A. G., Inglewood.

For thrush use a saturated solution of sulphate of copper. Wet a small piece of cotton and pack the crack full, changing once daily. Contracted heels will have to be remedied by proper shoeing.

Possibly Barley Beards.

I have a mare that has been troubled for a year or more with an enlarged thyroid gland. About a year ago the gland began to swell and become very tender. It broke and ran matter for a month or more, then healed, and later broke out again. I had it treated by a man claiming to be a veterinary surgeon. He called it fistula of the thyroid gland, claimed to burn it out with caustic, and finally healed it, although the glands were still enlarged. About a week ago it began to swell again and broke today, but ran very little matter.—W. B. W., Paso Robles.

I do not believe you have a suppurating thyroid gland; at least I never knew of one. If you had given me a description of its location I could give you more information. I suspect that you have barley beards in it, and if so it will discharge as long as they remain. The wound should be thoroughly curetted, scraped out; and when once thoroughly clean it will heal quickly.

Lumpy Jaw.

I have a cow with lumpy jaw. Kindly tell me if it is contagious; also if it is curable and how to treat it.—G. M. B., Vacaville.

Lumpy jaw, actinomycosis, is not contagious and is curable in most cases. Mix one pound of potassium iodide and one quart of water, and give one half ounce of the solution twice daily. It may be necessary to repeat it.

Quarter Crack.

We have a valuable mare whose front hoof has cracked clear down two inches from the heel. We would be very grateful for information effecting a cure.—R. J. B., Los Gatos.

Your mare has a quarter crack. Trim the horn on each side of the crack about one-half inch and file the length of the crack and almost through to the quick. Fill this with tar and bind hoof with adhesive plaster or black tire tape.

Open Joint.

I have a young mare cut by barb wire about four weeks ago. The cut is located on the right fore leg just above the knee. I noticed a clear mucus substance running from the wound. A veterinarian gave me a healing powder. The wound was doing very well but now two places have broken out on the side of the knee, which discharge matter streaked with blood. She is lame and quite stiff in the joint. I am now treating the wounds with hot compresses. It seems to have inflammation. Is my treatment right? If not, please give some remedy that will cure if possible.—M. J. P. H., Santa Ana.

The clear substance you mention is probably synovial fluid. I think you have got an open joint and it is probably incurable. My advice is to kill her.

RELIABLE REMEDIES.

Under this heading will be mentioned some of the Veterinary Remedies used by Dr. Whittlesey and which the readers of the Cultivator will be most likely to find useful. They are not ordinary proprietary mixtures put up to sell but are from old well tried formulas, whose effects have been tried in an extensive practice in Southern California of nearly a quarter of a century.

Dr. Whittlesey's Sulpho-Arsenical Salve for the cure of deep fistulous ulcers in any part of the body. "Pole evil," "Fistulas," "Quitters," "Thrush," "Scratches or Grease Heal," "Warts," "Collar-sores," "Sit-fasts," in fact any chronic, indolent sore that refuses to get well under other treatment. $1.00 per package post paid with full printed directions for its use in different sores.

Dr. Whittlesey's Antiseptic Healing Powder for forming a coating or scab over large raw surfaces, to exclude the air, keep away flies, and destroy floating germs which may lodge on the sore, makes a very cheap and convenient dressing for wire cuts, fresh collar sores, and any of the many sores occurring to stock on the ranch. $1.00 pound can post paid. Enclose your dollar in an envelope and we will take all chances of its being stolen.

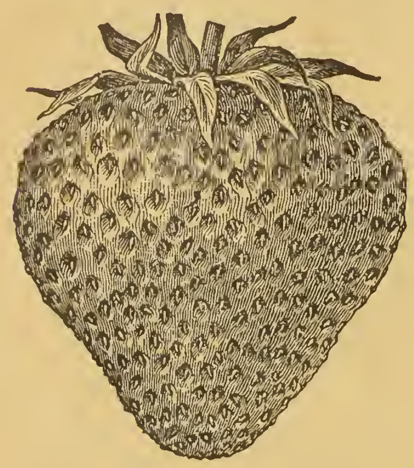
Farmers, Take Notice

To increase your crop in quantity and quality you must fertilize. The Tom Lewis fertilizer insures big crops for everything that grows. The best and cheapest fertilizer made. It is the farmers' money maker. No trouble to use. Big crops are sure to follow. This fertilizer produces 6 to 10 pounds of grapes to the bunch. For catalogue and prices write

Thomas Lewis, 1916 10th Street, Sacramento, Cal.

When writing advertisers, mention Cultivator.

100,000 The Dollar Strawberry



The phenomenal strawberry that has crowded out many of the old standard varieties, and which is now being grown almost exclusively in some of the leading strawberry districts of California. It combines three most desirable characteristics which make it a pronounced success from a commercial standpoint, viz., it is an upright grower, a heavy cropper and good snipper. Of upright growth and shy of runners, it may be planted closer than the average variety, insuring a larger yield per acre. The berries are borne on large crowns and are firm, sweet and juicy. The "only" strawberry for California.

Hay.

Somers & Co. say: In the country districts there is a tremendous demand for alfalfa, which was generally anticipated but greatly increased on account of the cold weather which we have had, killing and keeping back the green feed which had started. Undoubtedly the country demand for alfalfa will continue but will be dependent of course upon later weather conditions. We have reports that in some districts in the San Joaquin valley which generally ship considerable alfalfa to market there is such an active trading among local people that prices there are considerably higher than can be quoted here in San Francisco.

Citrus Market

LOS ANGELES, Dec. 29, 1908.

The Holiday shipments of oranges ended with satisfactory returns as a rule. The earlier and greener shipments resulted unsatisfactorily but it is hoped the green taste will not remain and that all future shipments command full price. The frost scare seems to have passed as the injury is now estimated to be exceedingly light.

Lemons are going forward regularly and commanding better prices than earlier in the season. The frost injury to the young setting crop will be comparatively light becausec of the amount of young fruit on the tree being very light.

Shipments to date this season, 1339 oranges, 607 lemons. To same date last season, 1491 oranges and 550 lemons.

NEW YORK, Dec. 28.—One mixed car, three cars navels, five cars lemons and two cars Arizona navels sold. The market is strong on navels. There is a good demand for lemons. The weather is clear and favorable.

If your application is accepted, you can come now or later. Write for booklet. Room 304, 45 KEARNY St., San Francisco, Cal.

FERTILIZERS.

PROFIT IN FERTILIZING
depends as much on judicious purchasing of fertilizers as on the intelligent study of the requirements of the crop. You may get the analysis you want, but from cheap materials of slow availability. When you buy
ARMOUR'S ANIMAL FERTILIZERS
you are assured of the highest grade of materials. They can be depended upon for results. Send for copy of Fertilizer Facts"
THE ARMOUR FERTILIZER WORKS
Los Angeles, Cal.

HOGS.

REGISERED BERKSHIRE AND POLAND China hogs, both sexes. C. A. STOWE, Stockton, Calif.

Vacaville Fruit Company, composed almost exclusively of growers, has shipped during the past year 214 cars. At a recent annual meeting the old officers were re-elected, as follows: L. J. Harbison, president; C. M. Hartley, vice-president; H. C. Blake, secretary; C. J. Uhl, treasurer; and these, with T. H. Buckingham, R. E. Burton and J. N. Rogers, form the board of directors.

The walnut men are somewhat concerned over the outcome of the hold over walnut crop, and efforts will be made to bring the Walnut Growers' Association on a stronger basis. It is feared by some, however, that the hold over may result in a weakening of the old association unless immediate steps are taken.

Sutter county rainfall to date amounts to 4.26 inches.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

IN THE COUNTRY.

I would fly from a city's rule and law,
From its fashions and forms cut loose,
And go where the strawberry grows on its straw
And the gooseberry grows on its goose;

Where the catnip tree is climbed by the cat,
As she clutches for her prey—
The guileless and unsuspecting rat,
On the rattan bush at play;

I will watch at ease the saffron cow.
And the cowslip in their glee,
As they slip in joy from bough to bough
On the top of a cowslip tree.

And list while the partridge drums his drum
And the woodchuck chucks his wood,
And the dog devours the dogwood plum
In the primitive solitude.

Oh! let me drink from the moss-grown pump
That was hewn from the pumpkin tree!
Eat mush and milk from a rural stump,

From folly and fashion free—
New-gathered mush from the mushroom vine,
And milk from the milkweed sweet—
With luscious pineapple off the pine;
Such food as the gods might eat.

And then to the whitewashed dairy I'll turn,
Where the dairy maid hastening hies
Her ruddy and golden-red butter to churn
From the milk of the butterflies.

And I'll rise at morn with the earliest bird,
To the fragrant barnyard pass,
And watch while the farmer turns his herd
Of grasshoppers out to grass.

—Pacific Union.

AN ENCOUNTER.

THERE was a dark spot surrounding the young man's left eye and various cuts and bruises were sprinkled impartially over the rest of his countenance. He walked as if his knees were stiff and he occasionally rubbed the back of his neck as if it hurt him.

"I'll bet," said his friend, after carefully studying him, "since you are six feet three, that the other fellow got the worst of it!"

"He was over six feet, too," said the battered young man. "You might call it a draw unless you were particular about fine points. Anyhow, he looks worse than I do! I——"

"Seems to me that for a man of peaceful instincts you've managed to do pretty well," said his friend. "I didn't think you lost your temper so easily. Still, in this hot weather there's no telling. What did you have against him? How did he irritate you?"

"It was howlingly funny," explained the battered young man. "At the same time, if any one had inquired, I might not have been of the same opinion, but time alters all things, you know, and the encounter was three days ago.

"His name was Timson, and he came from Oshkosh. But in spite of those drawbacks he was all right—college man and all that. I couldn't hate him even though he did cast eyes toward Betty Haswich, who is the prettiest of the Haswich girls, and whom I rather like myself.

"We were down at Mrs. Haswich's cottage for the week end and Timson and I were given a room together. It was a large room, with windows opening out on a balcony overlooking the lake, and when you went in you sniffed lavender.

"Timson had the luck to be the man on the spot when Betty Haswich and some others took it into their heads to go for a moonlight automobile ride. They said they were going to drop in on some friends ten miles away, and I knew what that meant—back not before midnight. Well, I talked with Betty's older sister and played a rubber of bridge and then went upstairs. I wasn't sleepy, for it was only 10 o'clock, but there didn't seem much to do. Funny, isn't it, how some persons always seem to keep things going and to make things interesting? That's why I like Betty.

"The moon was shining, and it was hot, so I went out on the balcony for a smoke. You know how dark it is in the country even with a husky young moon working? Well, the grounds were full of shadows and everything was still and mysterious. After awhile I began to grow drowsy from the effects of the moon and the quiet and the shadows, so I got to my feet and put one foot over the low sill of the window into the dark room. Then I stopped, for just coming stealthily through the door, was a man.

"He, too, stopped as my figure loomed up in the window. We might have been carved out of granite for a minute. I could hear him breathe—the deep breaths of a man who had been surprised. My heart thumped a little, too, for it isn't pleasant to run on a burglar. He hadn't made a sound coming upstairs or at the door. He evidently was an expert.

"I think we jumped at each other simultaneously. At the first grip I knew I had a fight on my hands that was going to be something good. I set my teeth and he gritted his, and we went at it hammer and tongs without a word of preliminaries. I found I needed all my breath for active service without wasting any on pink-tea conversation.

"He smashed my eye, and I cracked his jaw as we rolled over against the table and upset it. We fought all across and around that room with no regard for the furniture. Of course the noise was fierce and there were shrieks from all parts of the house. Presently, just as he was strangling me and I was yanking his hair out by the roots everybody burst in upon us with lights and some of the men pulled us apart.

"I wish you could have seen that room. Window curtains down, one chair smashed, the writing materials on the table scattered, the bed coverlet torn in two, the hardwood floor scraped and the rugs in hard knots. In the middle of the wreck and ruin were Timson and I, battered, bleeding, torn to pieces as to clothes, gasping like fish and trying to get at each other like two bulldogs!

"Oh, it was very simple. The automobile had broken down, as usual, two miles from home, and the party had come in by the road at the back. Finding the house in darkness, they had come upstairs quietly. Their idea was not to disturb us. That is what Timson kept repeating pathetically—that he hadn't wanted to disturb me, and so had come in carefully. He is a thoughtful man, Timson. Of course he supposed I was asleep and the man climbing in at the window was a robber.

"Betty said we both deserved what we got for being such idiots. I'm terribly afraid that girl is a flirt, and

doesn't care about either of us from the way she laughed. She hung to the door and simply shrieked. I'm going down next week to remonstrate with her for her heartlessness."

"Is Timson going, too?" inquired the friend.

"If he does," said the battered young man, "I'll finish him this time!"—Chicago Daily News.

FARMER'S FRUIT CAKE.

The goodness of fruit cake depends upon the quantity of fruit, the spices, and proper aging. Ordinary dried and preserved fruits if prepared in this way become just as tasty, and much less expensive, than the regulation currants, raisins, citron, etc.: Take one cup each of dried or preserved apples, quinces, peaches, prunes, watermelon, apricots, or plums, and chop into small pieces. There should be four or five cups of this chopped fruit. Put into a granite pan with two cups of molasses or sugar, and a little water. Add the spices, a teaspoonful of those preferred. Boil the fruit till it has absorbed all the syrup, being careful not to scorch. Let it cool and then stir in a cup of flour.

Make a simple cake batter of one egg, half-cup of butter or lard, one cup of sugar, half-cup of milk, two teaspoonfuls of baking powder sifted into enough flour to make a firm batter. Add half-cup of cocoa for coloring, and lastly the prepared fruit, and mix thoroughly. Bake slowly from one to two hours.

For aging, store away in earthenware crocks, occasionally moistening the cake with grape or blackberry juice. This cake in a few weeks becomes very richly flavored, and is so inexpensive that it should often be found in the school lunches and on the tea table.—Mrs. King.

HOMELY HINTS.

Spots and stains on frocks and coats are frequently the despair of the wearers, for nothing can make a garment look worse. The general effect of untidiness and dirt is repellant, and sometimes applications of soap, ammonia or gasoline seem only to make stains, etc., more prominent. This is partly because the cleaning agent has not been adapted to the material, and also because the work is improperly done.

It makes no difference whether silk, wool or cotton is to be cleansed, there must be a fresh piece of cloth underneath to absorb the soiled liquid that soaks through. Otherwise the cleaning fluid, laden with dirt, has no place to go and simply spreads over the original place. Several layers of absorbent material underneath are absolutely necessary, and it is doubtful if anything is quite as good for this purpose as cheese cloth.

Next to this condition it is important to spread the soiled place out on a smooth surface, that the spot may be watched to see that no dirty ring is forming. A skirt board or table is best for this, and the absorbent and scrupulously fresh cloth beneath should be large enough to move several times so that the old wet dirt may not be rubbed in again.

A bit of old white flannel is the best for wetting and rubbing, and there should be another with which to work the place dry, or nearly so. With care such as this home cleaning is quite practicable.

For removing grease spots from white linen or cotton goods use soap or weak lyes; for colored calicoes, warm soapsuds; for woolens, soapsuds or ammonia; for silks, benzine, ether, magnesia or chalk.

Spirits of wine will clean soiled silk embroidery. Dip a camel's hair brush in it and brush the trimming till the dirt is removed.

Vinegar and salt will brighten up copper and zinc with surprising ease and rapidity. All articles so cleaned must be washed in soap and water and then rinsed before they are put away. A little ammonia added to the water will hasten the cleaning process by attacking the grease.

The use of a little kerosene will lessen the work of dusting. Pour a little of the oil on a woolen dusting cloth and use it for wiping stairs and hardwood floors.

Porcelain bath tubs and basins are quickly cleaned, but iron sinks soon become thick with grease. A little kerosene added to the suds with which they are cleaned lessens the work. A tablespoonful of vinegar to one-half cup of water will remove grease from iron.

A piece of camphor gum placed in the silver drawer will keep the silver from tarnishing.

THE BEAUTIFUL IS OURS.

"Too many of us fall into the mistake of thinking that beauty is necessarily expensive. It is not so. Beauty is cheap, in the sense that it is to be had for the taking. We need not go without beautiful trees and shrubs and vines because we lack money with which to buy them of the growers. The nurseryman has not the monopoly of all that is desirable in this respect. Go into the fields and forests—and go with the seeing eye—and you will find ample material for the ornamentation of the home grounds—material quite as desirable as that which the dealer offers you at a good round price. So long as we can have native shrubs like the clethra and the elder and the spirea, the wild rose, the dogwoods and the alders, and many others that I need not mention here, and such vines as the celastrus, the ampelopsis and the clematis, we need not lack for material with which to make the home beautiful."—Eben Rexford.

OVER THE EGGS AND BACON.

He scraped with his knife a bit of butter off the sporting page.

"The writer of that poem on flying is accused of plagiarism now," he said.

"It's awful," she exclaimed. "the way these men go about the country marrying innocent women! Wipe your mustache, dear."

He wiped his mustache and, with a frown, inspected the result upon his napkin.

"Plagiarism." he said, "means a literary theft."

"Stole some books did he?"

"No, no; he stole ideas. They say a woman wrote the poem years ago."

"And now they bring it up against her, eh? Oh, these newspapers! But look at the mess you've made there with your coffee. I do wish you'd try to be a little more careful."—New Orleans Times-Democrat.

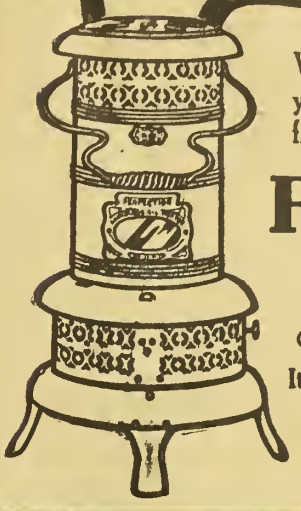
HOWARD'S REPLY.

The twins were being congratulated upon the arrival of a small brother when the neighbor inquired:

"Well, how did you boys like the boy?"

"Oh," answered Howard, nonchalantly, "we thought it was all right; but mamma would rather have had an automobile."

Glowing Heat
From Every Ounce of Fuel

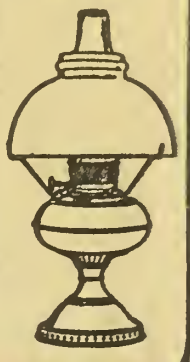


When the mercury drops out of sight, and you just *can't* keep the house warm, you'll find it wonderfully convenient to use a

PERFECTION Oil Heater

(Equipped with Smokeless Device)

It's very light—carry it about—heat *any* cold room. Turn the wick high or low—no danger—no smoke—no smell. Easily cared for and gives nine hours of cozy comfort at one filling of brass font. Finished in nickel and japan. Every heater warranted.



The **Rayo Lamp** with its flood of steady, brilliant light is ideal for the long winter evenings—you can sew by it—won't tire your eyes. Latest improved central draft burner. Made of brass, nickel plated. Every lamp warranted. If your dealer cannot supply the Rayo Lamp or Perfection Oil Heater, write our nearest agency for a descriptive circular.

STANDARD OIL COMPANY
(Incorporated)

Here They Are.

The newest styles from the country's leading factories. Good, or they wouldn't be here; low priced, or we wouldn't be telling you about them. Just think of the kind of vehicle you want and depend upon finding it here. Whether you buy or not your time will be well spent here. We make it part of our business to treat visitors right.

THE TURNING POINT.

In dealing with our natural resources we have come to a place at last where every consideration of patriotism, every consideration of love of country, of gratitude for things that the country and the institutions of this nation have given to us, call upon us for a return. If we owe anything to the United States, if this country has been good to us, if it has given us and our people our prosperity, our education and our chance of happiness, is there a duty resting upon us to see, as far as in us lies, that those who are coming after us shall have the same opportunity, and ought we, apart from any business consideration, apart from the question of the immediate dollar, to take up this question of the future wealth and happiness and prosperity of the people of the United States? It seems to me that in one phase of it, at least, this question rises far above all matters of business, all matter of the prosperity of the individual now, and becomes a great question of national preservation. And while we all have a right to a reasonable use of natural resources during our lifetime, while we all may use, and should continue to use, the good things that were put here for our use, in the last analysis this question is larger than a business question. It is a higher question than any other question which is likely to come before us, except the question of national preservation and national efficiency.

This is one of the great quiet crises that come in the lives of men and the lives of nations, and upon the decision which we make within the next very few years will depend the future of this nation throughout all of its existence. We have come to a great turning point and we have reached, fortunately, that turning point with a leader in the person of the President to point the way to a wise solution of the problem which comes before us. We have reached that turning point with every probability of solving the question right. None of us believe that this nation will be allowed to go down hill. None of us believe that the prosperity that we enjoy now, we shall fail to hand on to our people, but the only wise and reasonable basis upon which we can afford to proceed is that we shall change from the policy of recklessness of the past into a policy of foresight in the future,—Gifford Pinchot in American Industries for June.

OLD TRUSTY INCUBATORS AND BROODERS
The easiest to operate because it runs itself

We Pay Freight
Five Years Guaranty
Also the most durable. Made of the best materials and gives the perfect, even radiation of heat to all parts of egg chamber. Regulator so perfect that you might run it without a thermometer. Sold on
40, 60 AND 90 DAYS' TRIAL and Five Years' Guaranty.
Highest quality, fairest prices, fairest terms. No matter where you live, McClanahan, the Incubator Man, can save you money in prices and in results, and save you chicken troubles.
SEND FOR BIG FREE BOOK
Chock-full of common-sense chicken talk and straight from the shoulder money-making suggestions. 300 illustrations. It is Free. Write today sure, and get his special offer.
E. E. McClanahan 112 E. Eighth St., Los Angeles

HANDLING WATER FOR RESULTS.

There are four principal factors that go to make up plant growth: Light, heat, food and water. In all arid countries we usually have plenty of light and heat, and the soil is rich in plant food, but the water is really the controlling factor. Through it, all plant food is carried in solution to the plant and distributed to its various parts. We might compare irrigation to the lever on an engine; to one who does not understand how to manipulate the lever it might be a disastrous business to tamper with it. We might liken water to this lever of the engine, by supplying the right amount of water at the right time, and, in the right manner, the plant will grow to its full capacity from germination until the ripening period.

On new land where irrigation has never been practiced no water table has been developed or established; all water, therefore, supplied is absorbed by the ground until an excess accumulates, when the water table becomes established, its depth below the surface usually being governed by the amount of water supplied. It can be readily seen that more water can be applied on new land than on land that had been irrigated for any considerable length of time. Plants only use the ascending or capillary water, which we term moisture. All the excess, or the amount of water supplied in saturating the ground must be taken care of, either by under drainage, or evaporation before the plants can begin to use the capillary water. Plants do not use descending water, or water going into the soil; they can only use the capillary water coming up. In order to make the word capillary water understood, we might use this illustration. Take a handful of snow and just let it touch water, and the water will climb to the top of the sponge; this kind of water is what the plant uses. To saturate the ground with water and keep it so simply prohibits plant growth, and plants can be killed more quickly with an excess of water than by drouth.

Bearing these things in mind we can see that to irrigate is not to run water onto the soil, but to supply the needed moisture in such a manner that plants can use it.

It is seldom that you can find two plots of land exactly alike, that can be irrigated the same. Nor can we find two different crops growing on the same kind of land that require irrigation at the same time, as different crops use different amounts of moisture, and at different times.

The study of irrigation means a study of the soil, in connection with its depth, its mechanical condition, the kind of crops being grown, under drainage, and the depth of the water table, if any. When the soil is underlaid with sand or gravel, there being no hard strata between, a water table is seldom established, unless it be on bottom lands where the water level of the streams prohibit under drainage. But on uplands where the soil is very deep, or there is a hard stratum underneath the soil, sooner or later a water table will be established. On such soils water should never be used to excess, as alkali in harmful qualities will be developed and the cost of reclaiming them from the bad effects of these harmful salts will be greater than the original cost of the irrigation system covering such lands.

DIVIDEND NOTICE.

THE GERMAN SAVINGS AND LOAN SOCIETY

Member of Associated Savings Banks of San Francisco, 526 California Street. Mission Branch, 2572 Mission Street, near 22nd.

For the half year ending December 31, 1908, a dividend has been declared at the rate of four (4) per cent. per annum on all deposits, free of taxes, payable on and after Saturday, January 2, 1909. Dividends not called for are added to and bear the same rate of interest as the principal from January 1, 1909.

GEORGE TOURNY, Sec'y.

SEASON'S GREETINGS.

One of the neatest mementos sent out this season was by Silva & Bergtholdt Co. of Newcastle. This firm is proving to be one of the most enterprising and pushing of the nurserymen of the State, and the success which their big business is achieving is merited.

ALAMEDA COUNTY POULTRY SHOW.

The Coulson Poultry & Stock Food Co. had a fine display of Poultry Foods and Supplies at the Show, and distributed a large number of circulars and free samples.

One exhibit which attracted special attention was a "Fireless Brooder" in operation with young chicks, which had been successfully raised up to 2 weeks old.

ALAMEDA COUNTY POULTRY SHOW.

Among the prize winners was H. C. Scrutton, who won on White Minorcas: First, second and third cockerel; first, second and third pullet; first and fifth hen; third, fourth and fifth, cockerel. Cup for best display of Minorcas and cash prize for best display in the Mediterranean class.

The Del Valle Nursery, owned by H. L. Bauer & Sons of Los Angeles, is issuing a very neat little catalogue. All kinds of orchard and ornamental trees and plants are catalogued. Though condensed, the catalogue is quite complete with prices attached.

The seventh annual convention of the National Nut Growers' Association held an interesting and profitable meeting at Chattanooga, Tenn., Oct. 27-29. The election of officers resulted as follows: President, J. B. Wight, Cairo, Ga.; Secretary, J. F. Wilson, Poulan, Ga.
